An international transaction system for operation over the internet/intranet provides a pre-transactional calculation of all charges involved in any international transaction. Upon the option of the customer, the goods can be viewed on catalogue sheets translated to a language of the customer's choice, and the price provided in a currency selected by the customer. The customer also has the option of initiating the order with automatic credit authorization, generation of an electronic title or commercial invoice and arrangements and payment of shipping charges and any taxes and import/export duties.

FIG. 1B
UNIVERSAL SHOPPING CENTER FOR INTERNATIONAL OPERATION

This application is a continuation of Ser. No. 08/999,297 filed Dec. 29, 1997 which claims benefit of Provisional Application No. 60/033,984 filed Dec. 30, 1996.

TECHNICAL FIELD

The present invention is related to electronic merchandise catalogue and ordering systems for use on the internet/intranet. In particular, the present invention is directed to the facilitation of international purchasing of goods over the internet/intranet, addressing all aspects of such transactions.

BACKGROUND ART

Consumers have already discovered the advantages of shopping from their homes by the use of catalogues, television shopping channels or by computer transaction systems. There are numerous public internet web sites and private intranet sites that offer various articles and services for sale. Most of these public web sites and private sites operate in national configurations where the buyer and seller are restricted to a particular language and currency.

There are a number of transaction systems using electronic communications, including the internet, as conduits for carrying out an exchange of goods and funds. The conventional technology includes a number of examples containing some relevant elements for international transactions for goods to be sold across national boundaries.

U.S. Pat. No. 5,219,542 to King, Jr. et al., teaches a system for ordering items using an electronic catalog stored on a publicly accessible database. The patent includes a description of a related scheme of online catalogs provided by the Prodigy Corp., as set out in col. 1, beginning with line 26. The use of the Prodigy system suggests the use of the internet for providing both catalog information and as a conduit for entering electronic purchase orders to be sent to the vendors. A key aspect of the catalog system is that both public and private catalogs can be maintained. Both can be updated electronically, presumably through the internet since other methods are not described. The catalog system includes provisions for pre-negotiated prices and predetermined shopping lists for specific customers. A key marketing aspect of this system is the provision of product information since catalog data from multiple vendors is provided for the public electronic catalog. The authorization aspects of the requisition process appear to be limited to that carried out within a customer's own organization rather than through a third party bank or clearing house.

U.S. Pat. No. 5,420,405 to Chasek discloses a system of creating electronic or virtual money for personal transactions. The virtual money can integrate the functions of cash, checks and credit cards while the system provides constant surveillance against fraud. This virtual money is conceived as an international medium of exchange, and includes provisions for automated sales tax collections and payments. As a result, the purchase price is incremented by multipliers for city, state and federal tax within national borders. The system uses an on-person terminal permitting automated transactions of all sorts as well as record-keeping of personal accounts. This terminal system includes a known universal toll-paying system using point-of-sale debiting via radio signals. The Chasek system uses an electronic banking sub-system that can transfer funds between two individuals. The operation of the system includes the use of medium-exchange packets of bytes that identify the personal account custodian, the payer, the amount of transaction, the type of transaction, the vendor, a security number and a national code. Such a transfer uses a personal account custodian to transfer between the customer (who has transferred funds into a predetermined account) to another individual such as a vendor who then obtains access to those funds via the personal account custodian. Communications between personal account custodians and vendor account custodians are carried out using radio waves via a satellite transponder, insuring that a personal account custodian in one country can reach a vendor account custodian in another country.

U.S. Pat. No. 5,594,225 to Botvin discloses a method for conducting financial transactions via digital facsimile wherein the transaction is cleared after the draft documents faxed by the payer to the payer's bank are presented and processed via machine-readable equipment.

U.S. Pat. No. 5,666,493 to Wojcik et al. discloses a system for managing customer orders including an electronic catalog to streamline the buying functions. The system has an order management function, integrated with financial services to process orders and create financial records. The system also includes a logistics function for consolidating orders for optimum delivery over existing transportation systems. An inventory management system is also included and arranged to cooperate with the order management function. This functionality is achieved by accessing each subsystem data base on a real-time basis by horizontal integration of each subsystem to create an efficient data flow between the various subsystems. The selection of the details of transporting the goods is one of the subsystems that is accessed on a real time basis. Thus, customers entering orders can be provided with the shipping costs as well as other shipping details as the order is input. Likewise, credit authorization can be carried out on a real time basis as an order is entered. U.S. Pat. No. 4,926,368 to Morita et al. discloses an electronic currency conversion apparatus. Likewise, U.S. Pat. No. 4,766,293 to Bosten discloses a transaction card capable of authorizing a transaction using various currencies. U.S. Pat. No. 5,644,721 to Chung et al. discloses a computer reservation system using a "global currency" to carry out consolidation of travel reservations throughout the world. U.S. Pat. No. 5,644,115 to Fraser discloses a system for automatically matching sellers and buyers using, among other techniques, the internet. U.S. Pat. No. 5,351,189 to Doi et al. and U.S. Pat. No. 4,383,306 to Morimoto et al. both disclose electronic language translators.

If there are international sales, realistic currency conversions become a factor, as do issues of customs, import/export duties and shipping. These are not taken into account in conventional transaction system. Also, in conventional internet or intranet transaction systems the translations of all foreign catalogues, including the full terms of sale and shipping costs, are not always provided. As a result the buyer of goods from a foreign country often faces large, unexpected charges upon delivery of the goods. Such systems are clearly not suitable for a global market place or the requirements of doing business internationally.

SUMMARY OF THE INVENTION

Therefore, it is one object of the present invention to consolidate all the disparate components of an international sale into one program whereby a buyer can go shopping by computer almost anywhere in the world.

It is another object of the present invention to provide a transaction system whereby a buyer can go shopping by computer almost anywhere in the world using the buyer's own language.
It is a further object of the present invention to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world and see a display of goods priced in the buyers own currency.

It is yet another object of the present invention to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world and be provided with full shipping charges for the delivery of selected goods so that the shipping costs are paid as part of the overall price of the goods selected.

It is still another object of the present invention to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world and purchase products to be bought. After selecting products for consideration the customer can trigger calculation of all charges for the goods selected.

It is yet a further object of the present invention to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world and be provided with approved credit cards conventional system, or other electronic currencies.

It is still another object of the present invention to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world and be provided with approved credit cards conventional system, or other electronic currencies.

Yet another object of the present invention is to provide a transaction system whereby a buyer can shop by computer almost anywhere in the world to facilitate direct consumer sales or business to business sales.

Yet an additional object of the present invention is to provide a forum whereby manufacturers can expand into new export markets by way of a transaction system that allows a buyer to shop by computer virtually anywhere in the world, thereby lowering distribution costs to the manufacturers and as a result, consumer costs.

These and other objects of the present invention are achieved by a system for carrying out an international transaction over electromagnetic force (EMF) conventional links carried out over the internet using computer to computer communications. The process is initiated by accessing an internet web site or private site controlled by the international transaction program. The customer accessing the web site then selects a language in which to view catalogue information. The customer also selects the currency in which to pay for the products to be bought. After selecting products for consider-

BRIEF DESCRIPTION OF THE DRAWINGS

FIGS. 1(a) and 1(b) constitute a flow chart depicting the operation of the transaction system of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The design of the international shopping and transaction system of the present invention creates a seamless order entry system for shopping on the World Wide Web or private networks. A plurality of computer databases and systems are accessed to complete the functions necessary for both national and international transactions for the purchase of goods and services. All of the interactions between the various external databases and the transaction program are created by the user. Preferably, the language translation databases (not shown) containing the translations of all of the catalogue material are held in separate databases on computers.
separate from those handling the interface with the customers. This arrangement will save time and memory space for the computers actually-handling the transaction. The first database can be managed by the system operator of the inventive transaction system or can be external to the transaction system. In the latter case, the system operator can access such data over the internet, intranet or any other electromagnetic force (EMF) wave communications link.

Preferably, the user is provided with a plurality of different catalogues from among which to select on a real time basis. It is expected that many of the catalogues will be from sources outside of the United States, as well as the English-speaking world. Consequently, there must be pre-translated versions of catalogues in non-English languages, thereby allowing real-time access of each of the catalogues in a plurality of different languages.

This is handled by the first data base and processing center (depicted as 1st database in FIG. 1A) which serves as a catalogue builder. At step 106 a desired catalogue (and its country of origin) is selected and the country of the customer is input to select a default currency, which is used as a trigger to guide the operation or portions of the transaction process once a product or products are selected from the electronic catalogues. The downloading of the country of origin of the selected catalogue (step 106) also triggers an automatic access (step 191) of the translation database (2nd database and processing center in FIG. 1A) to provide the specific currency conversion between that of the original catalogue country and that of the customer as selected by the automatic defaults. However, the customer has additional currency conversion options as described with respect to step 112 supra.

Since a plurality of catalogues are contemplated, a “power search” for a specific product (or service) from among all of the catalogues is available to the customer in order to decrease the search time for the desired products. If an optional “power search” is requested at step 107, automatic access of the language translation database occurs to search the selected language versions of each of the catalogues contained therein. Once this has been done, a list of catalogues is provided to the customer in menu form so that the customer may view any or all of the catalogues.

At step 108 the customer selects and views a particular catalogue and product within that catalogue for consideration. The product is presented in menu form so that the variations and permutations, and other characteristics of the product can be studied. This is done in menu form in a manner well known in the conventional art directed to electronic catalogues. In the alternative, a catalogue from a particular vendor can be selected instead of going through the “power search” of the entire catalogue inventory. Further, the “power search” engine can be activated once more (step 107) to find a particular product in the selected catalogue. In the alternative, a printed index (such as those used in hard copy catalogues) can be provided.

Making a selection (step 110) from the catalogue produces linked web pages for any of the products listed. The power search function from the product page allows the customer to search for key words for one or all of the catalogues listed. In each catalogue a manufacturer’s index allows to look at products from a single manufacturer. The customer can also go backward or forwards through the program at any time. A picture (or several pictures) of the product are normally accompanied by a description of the product, name of the manufacturer, shipping weight, cost (in the customer’s currency), and other information about ordering options (available sizes, colors, styles, etc.) and the means to select multiple units of the product (with the desired options).

When a particular product is selected (step 110), a price in the customer’s currency, is automatically requested. Normally currency is chosen by default (based upon the selection of step 112). However, the customer has the option of selecting a particular currency (step 112) in which he wants the catalogue price of the selected products. The currency conversion (step 191) is carried out at the second database and processing center. This second database provides a “real time” conversion from the currency of the country in which the catalogue originates to that selected by the customer. The price is provided to the customer with a clear indication that this is the price for delivery at the vendor’s factory or at one of the vendor’s distributors, not the customer’s location.

However, there are difficulties with “real time” currency conversion. For example, because the currency trading is carried out electronically, there may be an almost constant change in the currency conversion rate. Consequently, it is necessary to freeze the conversion rate for purposes of carrying out a selected transaction at a particular point in time. This can be done automatically (step 116) at the time that the customer initially asks for the converted catalogue price by selecting a particular product. In order to compensate for any disparity between the quoted exchange rate and the real exchange rate when the transaction between the customer and vendor takes place (either independently or through the auspices of the present transaction system), the transaction system adds a small percentage to the conversion rate (step 117). This percentage can also accommodate any changes to the vendor or customer for using the transaction system and taking advantages of the conveniences inherent thereto.

At step 118, an automatic alarm is activated when one or both of the currencies in the selected conversion process are exhibiting wide fluctuations in value. Such fluctuations can be determined by the system operator so that when in the operator’s opinion, currencies become unstable, transactions in one or both of the subject currencies can be suspended by the system. Such suspension can be automatic or manual, depending upon the preferences of the system operator. When the decision is made, a message is sent to the customer (step 190) instead of a price, indicating that because of instability in the currency market, transactions in a particular currency have been suspended. At which time, the customer can be offered the option of an alternative currency, if such an alternative is feasible. For another option, the customer can be offered a higher price to compensate for wide swings in currency conversion values. Any or all of these opinions are presented to the customer along with any other desired catalogue information, at step 190.

Should the currency conversion be stable, the price is displayed (step 190) to the customer almost instantaneously after either step 105 or optional step 112. Also displayed with the price is a message indicating that the price displayed is limited to the vendor’s factory, or one of his outlets, however the vendor may choose. The message will also indicate that the customer must request additional information to obtain the price for the product to be delivered to a destination of the customers choosing. It is crucial that the message clearly indicate to the customer that there is far more expense involved to obtaining the goods than merely the original price at the factory or the distributor of the vendor. This is especially true if the vendor and customer are in different countries, such as the United States and the Netherlands. Table A below illustrates the situation.

</table>

Based on calculations addressing each issue in Table A (where appropriate), the customer is given the option of determining the real price of the transaction. If the customer makes this request (step 120), the next stage of the inventive process is carried out. Responsive to an affirmative answer by the customer, a commodity code for the selected product is obtained (step 122) by accessing the third database and processing center, containing look-up tables of the harmonized international tariff tables and classification system, as well as the formats for any necessary import/export data, and administrative requirements for all countries involved in possible transactions. If the vendor's country of origin or the destination country have commodity codes different from those of the harmonized tables, a search is conducted in other databases by the third database and processing center to determine the correct commodity code. This search (not depicted) will be used to look up other data related to the product and the country of destination, as well as generate appropriate documents from the third database. The commodity code can be displayed to the customer for his or her information. However, this is not necessary. Rather, the commodity code in conjunction with the country of destination is used to trigger certain subsequent operations of the inventive transaction process as depicted in FIG. 1 at steps 130 and 132 supra.

The "real price" or the price to deliver selected products to a specified point (presumably one convenient to the customer) entails the cost of all freight for each leg of the journey, insurance (if desirable), sales taxes, handling charges, document generation and forwarding charges, import/export duties, and "value added" taxes as well as luxury taxes (if applicable). The first step in calculating the cost of freight is to find out the total number of items to be shipped. This is input by the customer at step 124 At this point a determination is made between retail and wholesale transactions based on product type and amount (from the catalogue data), and customer identity. This determination can trigger the selection of shipping conditions at step 128 supra.

This operation will immediately trigger an operation (step 125) of checking with the vendor that the indicated number of the selected products is available. This is done by accessing (step 192) a fourth database and processing center (preferably generated and maintained by the selected vendor). This operation includes, automatically contacting the vendor and requesting confirmation of the inventory.
Should the requested number of products be unavailable, a message can be sent back to the transaction program to be displayed to the customer. Also, any additional information regarding product availability, such as expected delivery dates etc., can be provided at this time.

At step 126, the customer inputs the destination for purposes of calculating the cost of delivering the selected product or products to that destination. This information, in conjunction with the commodity code triggers the particular calculations for packaging, shipping, taxes, duties, insurance etc. of the rest of the transaction process. This is necessary to select the correct freight routes and charge. If, for example, the destination point is within the vendor’s country of origin (a determination made at step 193), the calculation of transport charges and duties is much simplified. Calculation of standard freight charges is provided, along with the optional insurance and any other charges, to the customer at step 127. This information can be displayed on the screen as soon as the customer indicates the destination point due to the simplicity of the calculations.

The options that can be displayed in conjunction with step 127 allow the customer to choose the various transport and insurance options that are available (depending on retail/wholesale status). Also, the vendor may offer a standard transportation package to customers that may be less expensive (because of vendor volume and leverage with carriers) than the options that would be available to individual customers. Where appropriate, customer selection of the options can be made at step 128 (if permitted by the vendor in a national transaction). A simplified operation of the inventive process would occur if a national transaction and no customer transport options were involved. As a result only sales tax would be added to the freight charges. Once the selections at step 128 are made, the sales tax can be computed automatically and displayed to the customer at step 129. For most domestic transactions within the United States, the process would end at this point unless the customer chose to enter the order and begin that part of the process dealing with credit confirmation and the transfer of electronic title and the shipping of the selected goods.

For international transactions (to which the present invention is more specifically directed) and situations in which a customer can select some freight options, the calculation of freight charges is far more complex. First, (at step 130), revenue units are calculated for the products to be shipped in four different ways, including: metric units for air transport; metric units for sea transport; standard English units for air transports; and, standard English units for sea transport. The precise calculations of each type of revenue unit is already well-known and needs no further elaboration for an understanding of the present invention. These calculations are standard in the shipping industry, and are based upon information derived from the third data base (triggered at step 122), including packing requirements for the selected product or products. The type of revenue unit selected by a vendor, customer or the instant transaction program depends upon a variety of factors, including: the country of origin of the vendor; the country of origin of the shipper; the type of product involved (commodity code); and, (most important) the least expensive method of transporting the goods at issue.

At step 132 a determination of the discrete legs or links of the overall transport route are determined based upon shipping data contained in the fifth data base and processing center. This is also done based upon a standard shipping route dictated by the vendor, the route requested by the customer, or some combination of the two. The transport route is further based on type of product indicated or the commodity code provided by the third data base, which also provides the shipping and administrative requirements of a specific product. In many cases, the various discrete legs of the route are dictated by the nature of the product being shipped. For example, an automobile being shipped from Germany to the United States will be transported by sea, and embarked on ship at the port in Germany most convenient to the automobile manufacturer. The manufacturer will most likely dictate that the sea transport take place from the German port of his choice to New York city. At which point, the customer has options of how the car will be taken from the wharf, through U.S. Customs, and to the final destination. Thus, between the vendor and the customer each discrete leg of the transport route is determined (step 132), as well as the costs accompanying each of those discrete legs of the journey (step 134).

An example of such expenses are found in Table A, which depicts an example of the costs for each discrete leg of the journey, and how such costs are added to the factory price of the goods of issue. Each discrete leg of route includes costs such as insurance, taxes, licensing fees, handling fees, and documentation fees. Thus, based upon the origin of the goods and the destination, as well as the revenue units for the package of the goods and the classification of the goods themselves, the cost of each discrete link is calculated using factors similar to the example found in Table A. The calculations take place in a number of sub-steps as indicated in Table A.

Of course, the sub-steps are determined by the origin and destination. At step 134, all costs such as freight, handling, basic taxes (such as sales tax) and documentation fees, insurance, import/export charges, and the like are calculated to provide a total cost to obtain the selected product or products at the selected destination. In many places import/export fees are based not upon a factory price of the goods but upon a first preliminary sum, including all necessary expenses to move the product or goods to the point at which the duties are assessed. These duties are added to create a second preliminary sum because under some conditions, additional taxes such as luxury taxes, value added taxes, etc. are based upon the second preliminary sum which includes transport expenses, some sales taxes and some import/export duties. So the final sum displayed at step 136 includes all of the taxes under all of the circumstances is based upon applying coefficients (based upon tax rates) to the previous two sums. The example of Table A indicates the kinds of values that are involved, and how some of the taxes in the destination country are calculated based upon previously calculated product cost, freight costs, insurance, taxes, etc.

The results of this calculation (step 134) are converted to the currency requested by the customer in the same manner as described with respect to steps 112, 116, 117 and 118. Thus, a potential customers has a display (step 136) the full cost of a foreign transaction displayed in front of him before the transaction is actually carried out. This is in contrast to other electronic or internet transaction systems, which do not address international transactions or any but the simplest tax and shipping charges.

At this point the customer has the option of investigating the prices of other products or of entering the order for the products selected. To order the products (step 140) the customer activates the appropriate area on the menu screen. This activation triggers two processes. In the first process an order is sent directly to the vendor electronically (step 142) requesting shipment to the customer’s destination. While this is the preferred method, the order can be buffered...
electronically by recording devices, or handled by human operators, or any combinations using the three to access the order entry operation of the fourth data base and processing center, preferably maintained by the vendor. The vendor can then process the order for the selected products deduct from inventory and arrange for shipping to the requested destination.

In order for the vendor to ship the selected products, it will be necessary that to access funds from the customer. Consequently, it is necessary that the electronic order also initiate a second process, confirmation of customer credit (step 150). This can be done by accessing (at step 150), a fifth data base and processing center, preferably a credit or funds transfer system. Preferably, this operation will be carried out using a credit card processing center to receive and encode the credit card number using a commercial security system such as PGP (Pretty Good Protection) to confirm the validity of the credit card. The same processing center can then send a confirmation for the respective customer order to the vendor (step 160) by accessing the vendor order entry system (fourth database). Transmission of credit data between customer, vendor and standard credit card system carried out by the instant transaction system.

However, standard credit card authorization is not necessary for the inventive system to function. A conventional authorization can be carried out using two commercial banks, one representing the vendor and the other the customer. This is the manner in which funds are usually transferred between two countries having different currencies. However, such transfers are often awkward and time consuming requiring exchange of papers and the approval of bank officers. Thus, the conventional exchange of funds between foreign banks could greatly hinder the operation of the inventive system even if carried out electronically by the present transaction system. Consequently, the use of international credit cards, such as American Express, is generally favored to expedite the operation of the present invention. However, even international credit cards can sometimes hinder the operation of the present invention due to limitations on the banks issuing the credit cards.

Consequently, another preferred method of authorizing credit includes the establishment of a system of clearing houses operating parallel to that of commercial banks and credit card organizations. Each vendor participating with the transaction system provider operating the present invention would make arrangements to accept credit verifications from local clearing houses established by the system operator in each country where the vendors are located. The clearing houses in different countries would be in direct electronic communication with each other over the internet, satellite links, intranet, dedicated data lines or any EMF communications links, providing data transfer secured by commercial encrypting packages, such as PGP or SET. The clearing houses in each country could accept local credit cards in the same manner as any local vendor. Thus, a customer’s local credit card could provide access to funds to a local clearing house like any vendor obtaining funds via credit card, which could transfer credit for the customer to a clearing house overseas without the necessity of passing through the complicated international banking procedures. A foreign vendor whose products are about to be purchased by the customer could be paid through a electronic clearing house that has received clearance from the clearing house in the customer’s country. The clearing house in the vendor’s country would act like a local credit card company, transferring funds to the vendor on behalf of the customer. Preferably, the entire transaction would take place electronically in the same manner that most credit card transactions are handled conventionally. Thus, funds available to a customer from local bank credit in the Netherlands could be translated into funds available to American factory which will send the car to a Virginia port for export as depicted in Table A.

Once electronic funds (or other authorization) are transferred to the vendor (step 161) from a local clearing house, the vendor will utilize a connection to the transaction system of the present invention to generate an electronic title (step 165) also referred to as a commercial invoice. Paper copies of the title or commercial invoice can also be generated from the electronic original for archival purposes or for presentation to entities requiring hard copies to further process the title or commercial invoice. Generation of the electronic title (at step 165) is done to create a faster transfer of title through all the official channels that must approve of the title and from there to the customer. The electronic title can be generated by the vendor or the instant transaction system upon authorization by the vendor. Conventionally the hard copy of the commercial invoice accompanies the goods and must be hand-carried to all of the official entities (such as the national customs services) that must process the papers, check the goods and authorize movement in and out of a particular country. Also, the conventional handling of the commercial invoices results in extra fees to the customer, but cannot be avoided since it must take place at every discrete leg of the shipping route. Further, the loss of these papers can be catastrophic in terms of receiving the goods in a timely fashion.

Upon generating the electronic commercial invoice (step 165 based upon vendor authorization or provided by the vendor), the vendor must carry out two types of activities. The first is administrative, and includes satisfying the requirements of the various governmental and regulatory entities controlling commerce and manufacturer at the location of the vendor (step 180). The second is to arrange transportation to the point requested by the customer (step 170). Under the simplest condition, this means paying the sales tax and a carrier to ship the goods at least part of the way to the customer’s requested destination.

However, when international transactions are involved, such as that depicted in Table A, a great deal more administrative work is necessary. Further, there are also added complications and expenses in the actual packing, handling and shipping processes. In such a situation, the vendor must arrange and pay (step 170) for transport from the factory to a shipping port, as well as all handling charges, warf fees, packing fees and the insurance that is always necessary when sending valuable goods by ship. A similar process takes place when goods are sent by air although there are fewer complications in terms of moving the goods from a terminal (usually where the national customs and export authorities must approve the goods) onto a plane. Of course, to move anything onto an international carrier such as a ship or a plane, the commercial invoice, packing list and any governmental release papers are needed, indicating that goods have been cleared for export. In the alternative the present transaction system can make the shipping arrangements on behalf of the vendor.

Along with the physical packing, handling and shipping of the goods, it is necessary to carry out the administrative functions. The present inventive system handles these (step 180) by sending electronic requests to the necessary governmental agencies based upon the commodity code from the harmonized and the country of destination. This combination will trigger a series of operations (out of a large number of possible operations) to satisfy the administrative
requirements for carrying out the transaction, including the
generation of all necessary documents based on data from the
third database.

For example, the combination of destination and commod-
ity code may automatically trigger a request to the
Department of Commerce (DOC) for an export license. This
can be done electronically since the DOC, like most gov-
ernment entities, is capable of receiving communications via
e-mail and responding thereto. The electronic title can be
sent as part of the request for the export license, and the
response from the state department returned electronically.
The electronic documentation from the DOC can then be
used to make a request to the State Department to obtain
clearance to export the subject goods, if the commodity code
and destination country justify that such a request be made.
The electronic indication of an export license from the
Department of Commerce and to the electronic clearance
document from the State Department can be sent electroni-
cally to the U.S. Customs service along with the electronic
title to obtain prompt clearance that will allow the goods to
be transferred quickly from the local carrier to an interna-
tional carrier such as a plane or ship.

At step 170, the vendor has the option of paying the local
taxes, local transport costs, insurance, packaging, etc.
himself, or contracting to have some of this done through the
inventive transaction system. For example, the transaction
system operator can arrange to pay local taxes, arrange for
local transport and insurance. However, because most ven-
dors currently have systems in place to efficiently handle
such tasks, it is unlikely that the duties will fall to the
operator of the transaction system.

On the other hand, the payment of export duties, export
license fees and handling through customs are tasks far more
suited to the present transactions system since it is normal to
have the customer pay for these requirements, and the
system operator has direct access to funds provided on
behalf of the customer, either through a credit card company
or the system operator's own electronic clearing houses. The
electronic documents can easily be converted into hard
copies if signatures are necessary and the signature con-
verted back to electronic documents. With the increasing
acceptance of government entities in general to accept
electronic signatures (such as that provided by a facsimile
machine), it is feasible that electronic signatures can be
attached to the modified electric documents by a number of
ways already well-known in the conventional technology.
Approvals from various government entities and the cus-
toms service can be added to the document electronically
either by machine or by scanning in the written signature
and stamps of an authorizing official.

When dealing with international carriers such as ships or
airplanes, goods to be transported are normally moved with
the commercial invoice attached thereto. The goods are
placed into the keeping of an official of the international
carrier (step 176), such as a ship's captain, and the captain
also takes possession of the commercial invoice (step 186).
Normally, a bill of lading and export packing list are
attached to the goods and a copy kept with the commercial
invoice. In conventional transactions, when reaching the
destination port, the international carrier official (such as the
ship's captain) will turn over the commercial invoices to a
commercial entity which specializes in moving the papers
from the carrier to the customs department of the destination
country. This also adds expense to international transactions.
However, with the present transaction system, the electronic
titles and export packing list for the goods can be transferred
directly from the international carrier official by system
operator to the national customs departments of the desti-
nation country at the port receiving the goods at issue (step
187). Normally this is done by carriers such as FedEx, UPS,
etc., and is often done in conjunction with moving the goods
off the warf/ramp/armac to the national customs area (step
177). Rather than providing a hard copy of a commercial
invoice, an electronic copy with the authorization of the
international carrier can be provided either as an electronic
document or a hard copy can be generated and provided with
the signature of an official of the international carrier.
Preferably, the electronic documentation will be presented
at the customs officials along with payment of the precalcu-
lated taxes, import duties, value added taxes, luxury taxes,
etc (step 188). Transfer of funds can be made electronically
to the national customs service or other governmental ser-
ices if this is permitted. Otherwise, the transaction system
of the present invention can arrange for the funds to be
provided to the international carrier or some other agent for
presentation to the customs officials when the commercial
title, bill of lading, etc. are presented so that the goods can
clear customs.

Once the goods have been moved out of the customs area,
a local carrier can take possession (step 178) and begin
delivery to the requested customer destination (step 179).
The present system is capable of arranging payments with
local carriers so that the customer does not have to go
through this process. It is expected that this arrangement
will be more convenient since the translation system operator
will probably have better arrangements with local carriers
that can be obtained by individual customers. The system
operator will also have direct access to customer funds to
ensure that payment to the local freight carriers is made.

Once the commercial invoice clears the customs service,
the document can be sent electronically via the internet,
intranet, facsimile, PTP, or any other convenient means,
directly to the customer (step 189). The electronic title,
modified in accordance with the customs regulations of the
two respective countries and the international carrier, will
provide a complete memorialization of transfer of the goods
from the factory to the final destination point. Based upon
the dates added to the electronic title, the customer will
know exactly where his goods were during the time taken to
traverse the route from the factory to the final destination.
Thus, the customer will have a complete record for moni-
toring costs and determining the point at which possible
damage occurred.

Once an order is entered (step 140) the customer infor-
mation is loaded into the customer database and inventory
information updated. The customer information can be used
to create customer profiles to be stored in the sixth database
(not shown) and processing center. Such information can
later be used to guide customers to catalogues or products
related to previous purchases, as well as previously selected
languages and currencies.

The present invention provides a comprehensive point-
to-point cost analysis for any international transaction, as
well as transactions conducted within a single country. All
costs are disclosed to the customer before the order is
actually entered. The transaction system also provides auto-
matic fund transfers via credit card systems or virtual
currency in clearing houses to carry out the transaction,
paying any necessary governmental agencies electronically.
By conducting electronic transactions, the necessity of for-
warding paperwork in international transactions is often
eliminated, and the overall costs reduced. Further, by pro-
viding an electronic title as the commercial invoice, the
documentation flow is facilitated, costs reduced and the
customer receives proof of purchase in a more timely fashion. As a result, international transactions can be carried out without unexpected charges being assessed against the customer upon delivery of the goods.

Although a number of embodiments of the present invention have been disclosed by way of example, the present invention is not to be limited thereby. Rather, the present invention should be interpreted as including all variations, permutations, adaptations, configurations that would occur to one skilled in this art who has been taught the present invention as construed only by the following claims.

We claim:

1. A computerized process for carrying out an international transaction comprising:
   running a transaction program on a computer system so as to integrate processes including:
   (a) receiving a selection of a product to be purchased and a destination for shipping such product to be purchased;
   (b) accessing at least one local or remote database for
      (i) price information for the product to be purchased; and
      (ii) a product code for an international goods classification system pertinent to such product; and
      (iii) international shipping information related to an origination point of such product and said destination;
   (c) calculating costs involved in moving such product to said destination based upon said destination and such product;
   (d) receiving an order for such product thereby triggering an electronic process for confirming existence of available funds; and
   (e) upon confirmation of availability of said funds, generating an electronic record, such record including the content of a commercial invoice, to facilitate passage of such product to said destination.

2. The process of claim 1, further comprising the process of:
   (f) moving said electronic record via EMF communications links from point to point along a route of passage to said destination for said selected products.

3. The process of claim 2, further comprising the process of:
   (g) providing authorization data at selected ones of said points along said route of passage by means of said electronic record.

4. The process of claim 3, wherein said process (g) of providing authorization data comprise the transfer of payment.

5. The process of claim 4, wherein said process (a) of receiving a selection of a product comprises the substep of distinguishing between foreign and domestic transactions.

6. The process of claim 4, wherein said process (g) of providing authorization data further comprises the substep of:
   generating documents from said electronic record where appropriate at said selected points along said route of passage.

7. The process of claim 6, wherein said process (g) of providing authorization data further comprises the substep of:
   payment of required transfer costs at said selected points along said route of passage.

8. The process of claim 1, wherein said process (d) of receiving an order is carried out using a single computer operation by a customer ordering said products.
