

US007702541B2

(12) United States Patent

Black et al.

(54) TARGETED E-COMMERCE SYSTEM

- (75) Inventors: Peter M. Black, Pacific Palisades, CA (US); Anthony Bryan Waters, Rowlett, TX (US)
- (73)Assignee: Yahoo! Inc., Sunnyvale, CA (US)
- Subject to any disclaimer, the term of this (*) Notice: patent is extended or adjusted under 35 U.S.C. 154(b) by 328 days.
- Appl. No.: 09/738,471 (21)

(65)

(22)Filed: Dec. 15, 2000

Prior Publication Data

US 2002/0016741 A1 Feb. 7, 2002

Related U.S. Application Data

- (63) Continuation-in-part of application No. 09/630,227, filed on Aug. 1, 2000, and a continuation-in-part of application No. 09/703,006, filed on Oct. 31, 2000, now Pat. No. 6,546,386.
- (51) Int. Cl. G06Q 30/00

(57)ABSTRACT

A system for displaying products for purchase on any document displayed on any computer device, comprising conducting a statistical frequency analysis of the word occurrence in the document to determine the primary subject matter of the document and/or keywords in the document, selecting products which are relevant to the subject matter and keywords of the document, either by manual selection or by automatic selection. Automatic selection is accomplished by conducting a statistical frequency analysis of the word occurrence in the product descriptions to determine the keywords in the product descriptions and matching the keywords from the document with the keywords from the product descriptions.

TARGETED E-COMMERCE SYSTEM

This application is a continuation-in-part of our application Ser. No. 09/630,227 filed Aug. 1, 2000 and our application Ser. No. 09/703,006 filed Oct. 31, 2000 (U.S. Pat. No. 6,546, 5 386 issued Apr. 8, 2003).

FIELD OF THE INVENTION

The invention relates to providing a system for providing a 10 list of related e-commerce products to any document appearing on a computer device.

BACKGROUND OF THE INVENTION

The Internet delivers trillions of words to billions of screens. The Net contains an enormous amount of material. Systems exist which survey web sites to determine the traffic (hits) that take place for a given web page. Some systems exist which will suggest products to a user based upon their selec- 20 tion of a particular web page or a particular topic. No system exists however, to analyze survey statistics to select and suggest e-commerce products that would be of interest to those persons selecting particular content and portions of that content, to suggest highly related products that can be purchased 25 by the user. This would be highly beneficial to create a market for those products to persons that are already recognized to be interested in a particular subject.

For example, while searching an article on basketball, various products could be suggested on the screen for purchase, 30 such as sports supplies, sports clothing and books and magazines on the subject of basketball. If it could be determined that the searcher was particularly interested in professional basketball, the products suggested could be narrowed to be more relevant to that interest.

OBJECTS OF THE INVENTION

It is an object of this invention to determine the interests of users of the Internet and suggest e-commerce products for 40 levels. These include: purchase, relevant to the user's interests.

It is a further object of the invention to provide a system to determine highly relevant products to suggest to internet users based upon their interest in or queries based upon any content, such as magazine articles, news stories or any other 45 text.

SUMMARY OF THE INVENTION

The targeted e-commerce system of this invention uses a 50 product database and an automated keyword tagging system to determine products that are best suited for display on a given content page. As the content is being prepared for publishing on a web site, it is tagged with one or more preselected keywords either manually or using an automated 55 tagging process as described in parent applications "Hotwording" application Ser. No. 09/630,227 and "Brilliant Queries" application Ser. No. 09/703,006. These keywords are submitted as input to a product database which selects one or more products for display on the page. The products are 60 displayed either as text entries, using titled thumbnails or other conventional techniques on product merchandising on electronic devices. The text entry, thumbnail or other method is essentially a link that leads to a product display page on the site or on a separate retail site. 65

The product database contains fields that describe the products along with their associated keywords. These fields might include the internal product id, the product url, the product price, the product title, the sale price (if any), and the full product description.

Products are associated with one or more keywords which are manually or automatically selected. An example of keywords associated with, for instance, "Basketball", would be "clothing" or "celebrity". All product keywords are listed in a product keyword table. Product selections are made by using the product keyword table to create a database match, or close match when multiple keywords are considered, with the keyword table from the content selection, to limit the product display to only products associated with specific keywords or multiple keyword clusters.

Product selection can be done statically for simple publishing content or the product selection can be performed on a server dynamically, to make products instantly available for display on the web site.

With the static publishing model, the product selection is done at the time the content is submitted for publishing and the chosen products are embedded in the page prior to upload to the server. These pages can be reprocessed and uploaded to the server repeatedly as the product database changes.

The dynamic publishing model relies on a product database that is running live on the server and gateway interface technology to query the product database and generate product selection on a query by query basis. This model allows for a product selection that is instantly updated on every content page as the product database is updated. If the product database has been enhanced via the above-described system of metatagging, then the match can be undertaken via sophisticated statistical matching techniques. If the product database is maintained without such enhancement, but is capable of responding to Boolean ANDed queries, then the matching can be accomplished through the automated submission of Boolean ANDed queries derived from the metatagging process, as described in the "Brilliant Query" application Ser. No. 09/703,006, filed Oct. 31, 2000.

Traffic survey data of web content may be done on several

- 1. Content selection, the general nature of the content.
- 2. Use of "Hotwording" as described in our parent application, which would provide data on both the content and keywording.
- 3. Use of a "Brilliant Query" as described in our parent application, which would provide data based on both a "hook" and a keyword.
- 4. Data from a targeted e-commerce site to which metatagging or keywords have been added with the methodologies described in this application, and its precursors.

The data can be analyzed by researchers looking at the word frequency analysis of the content and keywords chosen and then choosing products that are relevant to the subject matter. Products can also be chosen by adding metatagging or keywording to an inventory of products, and matching the content keywording to the product keywording.

As discussed in the "Brilliant Query" application, more definitive results will be obtained if keyword clusters, such as a doublet (a two word combination) or a triplet (three word combination) are analyzed, as they are far more revealing than a single word or general content category.

There will be cases where the number of products displayed on a given page will need to be limited. When the number of products matching the keywords for a given page exceeds this limit, there are one or more criteria for determining the products that are displayed. First, all products that are associated with all keywords are selected as a set. The product list is then ordered by one or more of the following optional criteria:

1) Date of product listing (how new is the product).

2) Product sale status (is there a special sale on the product?). 5

3) Product Price (more expensive or less expensive).

4) Keyword weighting (a product that matches the keyword that most appears in the content will be displayed before a product that matches a lower frequency keyword). The list is then limited to a prespecified number of products based on the site's design preferences.

As stated in the "Brilliant Query" application, Brilliant queries are a collection of one or more pairings of a hook and a keyword. For example, an article on Basketball might have the following Brilliant queries:

1. Search for more information on BASKETBALL and CELEBRITY

2. Search for more information on BASKETBALL and CLOTHING

20 3. Search for more information on BASKETBALL and FASHION

4. Search for more information on BASKETBALL and COMMERCE

The hook is BASKETBALL and the keywords are 25 CELEBRITY, CLOTHING, FASHION and COMMERCE.

Metatagged keywords are simply a collection of words, generated automatically or manually, that are deemed to be indicative of the topic matter or one of the topics for a given content selection. Metatagged keywords are determined by 30 comparison of a pre-determined list of keywords to the text of the content selection. If the content selection contains one or more of the keywords, or an appropriate synonym, then that keyword is associated with that text body and potentially used for the Brilliant Query. Keywords may also be determined by 35 statistical word frequency analysis of the text, with or without manual selection and addition of synonyms.

Keywords are generated by automatic or manual statistical and empirical analysis of the body of content to be enhanced or a comparable body of content. The keyword list for a given 40 least one of a link, a document, or a thumbnail. content source is generated through the use of word frequency analysis, stopword removal and finally, manual selection using empirical testing of the results generated by a given potential keyword. Based on experience, a solid keyword list usually runs between 250 and 1000 words and phrases which 45 are chosen by the system designer.

Also, keywords can be manually tuned through the use of a thesaurus feature whereby a given keyword can be associated with one or more synonyms that would indicate the use of the keyword whenever one or more of the synonyms appear $^{-50}$ in the body of text to be enhanced. This process is applied to both the content and the product database.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a depiction of a computer screen showing a body of text entitled, "Atomic Bomb" with targeted e-commerce offers;

FIG. **2** is a depiction of a list of Brilliant Queries, revealing $_{60}$ the keywords metatagged to the "Atomic Bomb" article;

FIG. 3 is a partial pre-selected product list, based on an Amazon product search on the phrase, 'Atomic Bomb';

FIG. 4 is a specific product merchandising page, revealing the keywords metatagged to this particular product; and

FIG. 5 is the reduced a list of the products that result from keyword matching.

DESCRIPTION OF THE PREFERRED **EMBODIMENTS**

FIG. 1 is a body of text comprising an Encyclopedia Electronica article entitled, "Atomic Bomb". Metatagged keywords associated with the article are shown in FIG. 2, as the second operand in each of the recommended "Brilliant Queries". Editorial judgment resulted in "Atomic Bomb" being the chosen as the "hook", the primary subject matter of the article, as indicated by it's choice as the title of the article by the Encyclopedia editors.

FIG. 3 shows a general list of matching products across all catagories results from a search on "Atomic Bomb" on the www.amazon.com product search engine. Keywords metatagged to one of the products found in the Amazon search, after analysis of the product description text, are indicated in FIG. 4 (right side, Features sidebar). The keywords metatagged to the original text can be matched to the keywords matatagged to the products, to provide a list of products which are highly relevant to the interests of the reader of the text (FIG. 5).

Thus, when the consumer/reader selects a particular article and a particular query from the text, a list of products available for purchase appears on the screen, the products being highly related to the query. Each of the products listed may contain a link to a retail purchase site.

Having thus described the invention,

We claim:

55

65

1. A computer implemented method of selecting at least one file representing at least one product, the file relating to a web page on the World Wide Web, the method comprising:

receiving the web page having content therein;

analyzing the web page to detect a context for the web page using a statistical analysis of the web page content; and

selecting at least one file representing at least one product related to the detected context.

2. The method of claim 1, wherein the selected file is at

3. The method of claim **1**, further comprising:

receiving notice of a user request for the web page, said user request being received after the execution of said selecting.

4. The method of claim 1, wherein said analyzing is executed to detect a plurality of contexts for the web page, and wherein said selecting is executed to select a plurality of products corresponding to the plurality of contexts, the method further comprising:

ranking the plurality of contexts and the plurality of products.

5. The method of claim 1, further comprising:

receiving notice of a user request for the web page, said user request being received prior to the execution of said analyzing or said selecting.

6. The method of claim 1, wherein said analyzing comprises:

parsing the content of the web page to discover one or more keywords published as part of the content; and

evaluating the one or more keywords to detect the context.

7. The method of claim 6, wherein said parsing comprises: performing a statistical word frequency analysis of the content to discover the one or more keywords.

8. The method of claim 6, wherein said parsing comprises: analyzing at least one metatag in the web page to discover the one or more keywords.

9. The method of claim 6, wherein said evaluating comprises:

comparing the one or more keywords with a synonym to detect the context.

10. A method of selecting and displaying at least one file 5 representing at least one product, the file relating to a web page on the World Wide Web, the method comprising:

receiving notice of a user request for a web page;

- receiving the requested web page having content therein; 10 analyzing the requested web page to detect a context for the requested web page using a statistical analysis of the
- web page content; selecting at least one file representing at least one product
- related to the detected context; 15
- producing a second page including the requested web page and the file; and

displaying the second page to the user.

11. The method of claim 10, wherein said analyzing is executed to detect a plurality of contexts for the requested web page, and wherein said selecting is executed to select a plurality of products corresponding to the plurality of contexts, the method further comprising:

ranking the plurality of contexts and the plurality of products, such that said displaying is executed to display the plurality of products in accordance with the ranking.

12. A computer readable storage medium including computer executable code for selecting at least one file representing at least one product, the file relating to a web page on the World Wide Web, the code enabling the steps of:

- receiving the web page having content therein;
- analyzing the web page to detect a context for the web page using a statistical analysis of the web page content; and selecting at least one file representing at least one product related to the detected context.
