A traffic control system selectively interfaces members of plural groups, as buyer groups and vendor groups, for video communication through a dial-up telephone system, for analyzing and compiling data, scheduling appointments, implementing conferences, consummating sales and the like. The traffic-control system comprises a telephonic interface apparatus for interfacing remote telephonic terminals of the dial-up telephone system identified with the members of plural groups, a video recording unit for recording and playing video transcriptions, a storage memory for storing data on the members, including telephonic terminal numbers and area-of-interest codes and a control computer to selectively interconnect the video recording unit with the remote telephone terminals through the telephonic interface apparatus to record and receive video communication.

COMMERCIAL PRODUCT ROUTING SYSTEM WITH VIDEO VENDING CAPABILITY

This application is a continuation of application Ser. No. 08/371,212, entitled "METHOD FOR BUYER-SELLER ON-LINE COMMERCE" and filed on Aug. 10, 1999, which is a continuation of application Ser. No. 08/189,405, entitled "COMMERCIAL PRODUCT ROUTING SYSTEM WITH VIDEO VENDING CAPABILITY" and filed on Jan. 27, 1994, now U.S. Pat. No. 5,323,894, which is a continuation-in-part of Ser. No. 08/154,313, entitled "SCHEDULING AND PROCESSING SYSTEM FOR TELEPHONE VIDEO COMMUNICATION" and filed on Nov. 17, 1993, now U.S. Pat. No. 5,495,284, which is a continuation-in-part application of application Ser. No. 08/067,783, entitled "VIDEOPHONE SYSTEM FOR SCRUTINY MONITORING WITH COMPUTER CONTROL," and filed on May 25, 1993, now abandoned, which is a continuation-in-part application of application Ser. No. 08/031,235, entitled "VIDEOPHONE SYSTEM FOR SCRUTINY MONITORING WITH COMPUTER CONTROL" and filed on Mar. 12, 1993, now U.S. Pat. No. 5,412,708. The subject matter in all the above-identified co-pending and commonly owned applications is incorporated herein by reference.

FIELD OF THE INVENTION

The present invention relates generally to the field of computerized telephone and video communication, and more particularly, to a communication traffic control system for providing video communication through a dial-up telephone system. It is particularly useful for medical doctors and other professionals, game playing, dating, business conferences, consummating sales and the like. Telephone switches are linked with computers to coordinate computer information and intelligence with call handling capability for automatically passing both the call and the caller's current record to an operator's telephone and terminal. This obviates the need for a person to obtain, enter and receive the caller's record from the database. Such advances have immensely enhanced human capabilities for communication, data manipulation and control functions.

Somewhat concurrently, rapid developments in computer, telephone and video technologies have introduced the concept of visual communications or video conferencing. In particular, efforts at integrating these technologies have gained enormous momentum in recent years, resulting, in part, from a general desire in all industries to conserve time and expenses, and thereby, maximize human efficiency and productivity. The advent of videophones has enabled users to visually communicate from remote locations. Many industries are rapidly embracing the idea of video conferencing or visual communication to eliminate escalating travel expenses. Employees or customers in different places can take part in interactive training sessions or seminars with no loss of time for travel.

However, obstacles remain, particularly in traditional areas of cumbersome communication. Still, with developments, virtually every industry segment can profit from interactive data sharing in real time with the added advantage of face-to-face communication. Innovative technical advances are fast satisfying promises of enhanced capabilities, thereby, allowing users to share and manipulate images from remote locations, such as pictures, graphs, maps or the like.

Technical breakthroughs in audio and video compression technology make desktop video conferencing and visual communication both economical and practical for everyday business communications. To fully participate in video conferencing, the user's equipment must communicate with similar units, albeit, from different equipment vendors. The International Telephone and Telegraph Consultative Committee (CCITT) has defined a standard called H.261 (or "Px64") detailing how video and audio signals are compressed and decompressed for transmission across a common link. At present, no one industry standard and format has been adopted for video conferencing systems. Thus, the systems available on the market are not always compatible. As a consequence, many different types of video codecs (coders/decoders) are currently in use. For example, the AT&T AVP CODEC is a three-chip set that digitally processes high-quality, full-motion video images and sounds that are compatible with the latest videoconferencing standards.

At any rate, ongoing efforts at achieving compatibility and providing compression schemes that can transmit color images over POTS (plain old telephone system) all over the world are in the offing. Approaches for incorporating live-action, color video with standard voice telephone lines via networks and modems are currently being introduced. By using a suitable video capture board and a modem, live video may be received and displayed on any 386 or 486 personal computer running Microsoft Windows™. The frame rate depends upon the type of display and type of communication hardware. For example, over a normal dial-up telephone line, a computer with a VGA (video graphics array) display set at 32,000 colors, a 486 CPU and a 14.4 kbs (thousand bits per second) modem can achieve a frame rate of 5 frames per second. The link between the personal computers can be
established in several ways, for example, by a modem, LAN (local area network), serial port and other high speed digital links.

To consider an example of cumbersome communication in the merchandising industry, wholesale vendors or sellers of goods typically spend many hours attempting to schedule appointments with various buyers for different organizations, travelling to and from the buyers' facilities, and waiting for meetings, which may sometimes last only a short duration. Unfortunately, considerably more time and expense is incurred, in travelling to and from different facilities, than is desirable. Moreover, as a practical matter, specific vendor sales people are typically assigned to merchandise specific goods and interact with specific buyers, resulting in a need for more vendor personnel dedicated to particular buyers.

Moreover, in the event a specific seller wishes to broadcast a special offering of a particular item to plural buyers, for example, to dispose of an inventory of distressed items, the seller must undertake considerable effort, such as place an advertisement or otherwise initiate contact with buyers. An advertisement is likely to be viewed only by random buyers, thus, not always proving to be a reliable method of soliciting offers from all possible buyers. Moreover, initiating individual contact with a series of buyers, until eventually securing a final sale, constitutes an arduous task. Similarly, in situations where a buyer wishes to solicit proposals from vendors for a particular item, the same practice prevails.

Accordingly, the present invention recognizes the need for a system to communicate with remote locations over a widely distributed area, from other places, such as a central location, for the applications discussed above as well as many other diverse applications with similar requirements. In particular, the present system recognizes the need for directing and exchanging communications, such as offers and responses, between select members of plural groups or sub-groups, analyzing and compiling data relating to such members, scheduling appointments, implementing face-to-face conferences (in real-time), and consummating transactions and billing relating to transactions between such groups.

**SUMMARY OF THE INVENTION**

Generally, the system of the present invention involves traffic regulation and control for video communication between a plurality of remote, widely distributed locations, from a central unit, utilizing dial-up telephone facilities in today’s computer environment, and with voice quality lines. Specifically, for example the dynamic graphics of telephonic video (on standard analog lines and digital lines over Integrated Services Digital Network (ISDN)) facilitate videophone, while video still displays and digital lines facilitate high fidelity (hi-fi) video displays along with audio capabilities, all combined with the interactive capability of computers to attain an effective commercial product routing system with video vending capability.

The system of the present invention contemplates applications ranging from merchandising (including purchasing, selling, marketing or the like) to educational conventions for medical doctors and other professionals, game shows, dating services and so on. The present system is configured to direct and exchange communication traffic, for example, in the form of offers and responses, between selective members of plural groups or sub-groups, such as vendors and buyers, for analyzing and compiling data, scheduling appointments and implementing visual conferences, consummating transactions and the like. Selective routing of communication traffic from a central unit or controlled by the central unit effectively prevents information overload.

In one disclosed embodiment of the present invention, personal computers equipped with capabilities for providing either analog video (analog motion and analog high resolution freeze frame) or digital video or both, and speakerphones (or regular telephone instruments), for one-way or two-way communication are placed at each of a plurality of remote locations to communicate with a central unit that may include several communication and control stations also equipped with some or all of the same capabilities. As a part of traffic control operations, a video display (depicting motion and color) may be provided with graphics, audio and data signals, at each communication and control station, as well as, the remote locations. The personal computers may utilize well known image enhancement techniques to facilitate high resolution images for closer observation.

In accordance with one exemplary embodiment related to wholesale merchandising, a telephonic interface appointment scheduling and routing system includes a central traffic control system, independently managed by a third party and located remote from all vendors and buyers' facilities. The central traffic control system schedules and routes offers and responses to and from select members of plural groups, such as buyers and vendors, to expedite traditionally complex purchasing operations. Routing of offers and responses may also take place between members of sub-groups of plural groups. Calls may be classified into types, for example, a vendor with a special offering, a buyer responding to a special offering, a buyer soliciting proposals, a vendor responding with a proposal and a vendor or a buyer seeking an appointment. Calls of the various types may involve some form of qualification or approval. For example, access to the system may be limited to qualified or registered entities. Also, limitations may be imposed, such as calls revealing one vendor's proposal to a competitor are inhibited.

In accordance with an example, a vendor may wish to broadcast a special offering of a particular item to interested buyers. The routing system analyzes buyer data, typically acquired during registration, and compiles a list of buyers to whom the broadcast is transmitted. Special buyers may be specified by the vendors making the special offering. For example, a vendor may designate special buyers from a list of all participating buyers and vendors provided to each registered member. From time to time, periodic updates on new members may be circulated.

To facilitate equitable routing of special offers to all interested buyers, in situations, where there are only a limited number of communication lines, the routing system may include a random number generator to randomly select subsets of buyers and may transmit the broadcast in sequence to each subset. In some situations, the routing system may have the capability to request and add additional communication lines in the event a caller (vendor or buyer) desires concurrent broadcast to all potential receiving parties. Of course, in such cases the caller would incur the additional charges. A numbering system may also be adopted, whereby broadcasts are transmitted to subsets of a designated number of buyers (for example, equal to the number of communication lines) in rotating sequence. For example, a particular special offering may be broadcast first to subset number one, then subset number two and so on, while the next special offering may be broadcast first to subset number two, then subset number three and so on. A video recording of the offered item may be stored in a video file server at the central location, thus, allowing interested buyers to view the item prior to making a purchase. Likewise, buyers may wish to solicit proposals for
a particular item from vendors qualified for designated merchandise. Communication between the routing system and the different buyers and vendors may be accomplished in a variety of ways, as for example, by electronic mail (transmission of messages across a network between two desktop PCs), electronic bulletin boards, on-line computer services (such as Prodigy® or CompuServe®), facsimile, voice-mail or the like.

Vendors and buyers may directly communicate with the central traffic control system to seek or change appointments and update information with respect to appointments with specific buyers. In accordance with one scenario, vendors may call the central traffic control system and, upon qualifications at the vendor site. That is, as disclosed, the central traffic of the current vendor. As disclosed, a single monitor may accommodate several formats or plural monitors can operate selectively for concurrent multiple displays.

A sequence of scheduled appointments may be developed, as programmed along with intervals of video communication. A record of the scheduled appointments is maintained by the central traffic control system.

At the appropriate times, identification designations for remote locations are provided in sequence, to address a memory for fetching telephone numbers and/or graphic display data also recorded when the appointments are scheduled. Accordingly, in sequence, vendor locations are dialed up via the public telephone system, either manually or automatically, to obtain audio-video communication providing an image of the vendor and the surrounding area at a specific vendor location.

Additionally, data associated with a vendor (or a buyer) may be graphically displayed for convenient reference. For each scene display with respect to a specific vendor, the graphic display of pertinent data provided may, for example, indicate the telephone number, the PIN number, the video format, vendor rating, current vendor delivery status and so on.

Special controls such as a mouse may be instituted enabling manifestations at the vendor location to initiate action or alter the display. Special operations also may be commanded through the videophone, video still (high quality), or high fidelity (hi-fi) video means either on manual initiative or automatically by automatic apparatus.

A video recorder and/or video printer may be located at a remote vendor location, central traffic control station or buyer location for selectively or continuously obtaining a video recording or video printout of displays.

Multiple coordinated central traffic control stations may be employed to communicate with widely distributed vendor or buyer locations with capabilities to route calls to each other, in the event that all of the communication lines are occupied and when there is a considerable backlog of calls. Calls may be routed to the next available operator (buyer), for example, in the event appointments scheduled for a particular buyer last longer than contemplated, or another buyer familiar with that line of products may step in and handle the appointment.

Under some circumstances it may be desirable to prioritize calls. For example, appointments may be queued in sequence, specific appointments may precede other routed appointments in accordance with an override feature.

A record of the number of calls and related charges incurred by the buyers for appointments is maintained, which may be analyzed and ultimately rebilled to the vendors. Of course, charges for scheduling are incurred directly by the vendors. Also, a record of charges incurred for each caller (buyer or vendor), depending upon the transaction initiated, may be maintained and billed to each caller.

These as well as other features of the present system will become apparent from the detailed description which follows, considered together with the appended drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

A complete understanding of the invention and its advantages may be gained from consideration of the following description of some disclosed embodiments taken in conjunction with the accompanying drawings, in which:

FIG. 1 is a block diagram of the system in accordance with an override feature.

FIG. 2 is a detailed block and pictorial diagram of the system of FIG. 1, illustrating the basic components of the scheduling and routing system;

FIG. 3 is a graphic representation of a portion of the control panel of an element in the system of FIG. 2;

FIG. 4 is an exemplary format of an identification card issued by the scheduling and routing system;

FIG. 5 is a more detailed block diagram illustrating the central traffic control system of the scheduling and routing system of FIG. 2;

FIG. 6 is a logic flow diagram illustrating an exemplary operation format of the system of FIG. 5 for automated qualification of callers, such as vendors or buyers;

FIG. 7 is a fragmentary diagrammatic representation of an exemplary storage cell for information specific to a vendor, as may be formatted in the system of the present invention;

FIG. 8 is a fragmentary diagrammatic representation of an exemplary storage cell for information specific to a buyer, as may be formatted in the system of the present invention;

FIG. 9 is an exemplary form indicating a buyer's request; and

FIG. 10 is an exemplary message transmitted from the central traffic station to a buyer or a vendor.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

As indicated above, a significant aspect of the scheduling and routing system of the present invention is based on recognizing that a dial-up public telephone system may be effectively utilized for visual communication and conferences between a plurality of remote locations regulated and controlled by a central traffic control station. More specifically, it has been recognized that for an effective communication traffic control system, dial-up voice quality lines, such as standard analog or digital lines, may be employed variously in conjunction with videophone equipment, computer facilities (personal computers (PCs) with video capabilities) and various forms of telephonic equipment as voice generators, auto dialers and D-channel or in-band signalling apparatus.

To that end, a dial-up public telephone system TS is illustrated in FIG. 1 (upper center) affording effective communication. Between a plurality of remote locations, for example, locations L1-Ln representing vendor sites, and at least one central traffic control station TS. For merchandising appli-
may employ individual merchandise buyers responsible for purchasing specific categories or sub-categories of items. For example, one buyer (person) may be responsible for purchasing body treatment products, such as skin and hair products, another buyer may be responsible for purchasing vitamins and over the counter medications, and yet another for purchasing magazines and toys, and so on. The present system facilitates selective transmission of communications between individual buyers of plural buyer groups or sub-groups and qualified members of plural vendor groups or sub-groups. For example, special offerings by vendors for particular merchandise may be transmitted only to buyers designated for purchase of the merchandise. Likewise, buyer requests for proposals on select merchandise are transmitted only to vendors designated to sell the merchandise. Similarly, appointments for conferences may be scheduled by vendors or buyers, although in keeping with present merchandising practices, it is generally contemplated that vendors would pursue scheduled appointments. However, appointments are generally verified by buyers and appointment execution calls are generally initiated by buyers, either directly or automatically using autodialers.

A fully automated interactive voice response system including ARUs (audio response units) may schedule appointments for specific buyers and subsequently, load schedules for all the buyers into a memory at the central traffic control station. Alternatively, each specific buyer’s schedule may be transmitted to and loaded into a memory at each buyer terminal. In some instances, vendors may communicate with the traffic control station in any of a variety of ways (touch-tone, electronic-mail, voice-mail, facsimile or the like) to make and/or verify appointments and/or initiate the conferences, if necessary. In addition, buyers may also communicate with the traffic control system to approve appointments, or otherwise update information in any of a variety of ways (touch-tone, electronic-mail, voice-mail, facsimile or the like). During visual conferences (in real-time), vendors may display their goods, packaging or promotional displays and otherwise effectively communicate with the buyers.

Along with a video signal display (real-time, color, motion, freeze frame), under manual or computer control, audio and data signals are employed to supplement and enhance conferencing operations. In an exemplary system, each of the vendor locations may incorporate several video speakers (with one-way and two-way communication and echo canceling), a camera (separate cameras also may be used to concurrently provide images for a videophone and high quality still images), switches, automatic dialing devices and computer memory capability for initiating and responding to commands from the central traffic control system, as well as, for initiating various actions to accomplish change or to accommodate special circumstances.

Conventionally, in merchandising applications, it is appropriate for the vendors to incur communication expenses. To facilitate this, a reduced rate service for long distance outbound calling, for example MEGACOM, may be installed at each of the buyers’ facilities. Data on calls made by the buyers may be obtained from the telephone company (e.g., AT&T telephone company) and analyzed to isolate calls made to each specific vendor and thus, the cumulative charges incurred may be computed. For example, outgoing call activity may be monitored at each of the buyers’ facilities or the independently managed, central traffic control site and rebilled to specific vendors. Alternatively, toll free or “800” services at each of the vendor locations may be installed, and “800” number calls initiated by the buyers may be billed to each of the vendor locations. Further, the central traffic control system may include a central detail service to contract for and install telephone services at both the buyer and vendor locations, in order to obtain and report on calls to and from the buyers, as well as, centrally bill both buyers and vendors for all video telephone communications.

Considerable other data may be developed and stored. For example, the central traffic control station for each buyer facility may maintain a record of outbound calls made by all the buyers located at that facility including data, such as the date and time of the call, the name of the buyer initiating the call and the duration of the call. Accordingly, information for each buyer may be subsequently compiled. Likewise, the central traffic control station may maintain a record of all the calls made by each vendor. For example, a specific organization may wish to ascertain the number of vendor calls to a particular buyer. Accordingly, the central traffic control station may compile such data by comparing vendor outbound calls with a database of buyers (including information, such as telephone numbers, names etc.). Furthermore, in some cases, a summary of each buyer’s efficiency may be recorded and provided to interested parties. For example, a buyer’s efficiency may be ascertained by the number of video calls made by a specific buyer every week, the average length of the video call, and other data displayed from the database, namely, name of the vendor, names of the persons participating in the call, and so on. For example, for a particular buyer a summary could indicate that during the week of Mar. 20, 1993, forty calls were made for an average length of twenty minutes. Detailed information may further indicate that specifically at 10:00 a.m., on Mar. 20, 1993, a first appointment with Mr. John Blow, of ABC Fruit Company was initiated, which lasted for 1 hour and 12 minutes, and at 11:12 a.m., a second appointment with Ms. Mary Smith of XYZ Cutlery Company lasted 11 minutes and so on.

The central traffic control station TIS may automatically place a call (for example, to broadcast a proposal request from a buyer) to the appropriate vendor locations, determined by a database of vendor locations qualified (for example, by specific category or sub-category) for the particular merchandise for which the buyer requests proposals. Likewise, when executing appointments, the buyer may place a call to the appropriate vendor location, determined also by a database associated with the particular one of the vendor locations L1-Ln, with which the specific buyer has an appointment scheduled. Alternatively, the buyer may actuate an autodialer, such as the autodialer code number (obtained from the central traffic control station database) displayed on the buyer’s video terminal connects him or her to the appropriate vendor. In the event there are complications or otherwise, the buyer may use a regular telephone or a cellular telephone and manually dial the telephone number displayed on the video terminal. It is currently recognized that cellular transmission will ultimately provide dynamic motion and high resolutions freeze frame displays.

The illustrated embodiment of FIG. 1 shows the independently managed, central traffic control system TIS (right), located remote from the buyer systems illustrated at BS1-BSn and the vendor terminals L1-Ln. Under control of the central traffic control system TIS, communication is provided through a dial-up public telephone system TS, between the
vendor terminals L1-Ln and the buyer systems BS1-BSn. The
buyer system BS1 is shown in some detail, specifically, as
including a telephone interface switch SW coupled to a con-
trol computer CC for regulating a plurality of monitor stations
V1-Vn.

Preliminarily, considering an exemplary sequence of
operations with reference to FIG. 1, assume that different
vendor terminals L1-Ln are equipped with videophone, video
still (high quality) or hi-fi video capabilities. Alternatively,
the vendors may have desktop personal computers incorpo-
rating live-action, color video with standard voice telephone
lines via networks and modems.

Each buyer system BS1-BSn may be equipped with a plat-
form to accommodate select communications with various
vendors. Assume that a person at vendor location L1 wishes to
schedule an appointment with a buyer at buyer terminal V1.
As a result, telephone equipment at the location L1 is actu-
ated, either manually or automatically, prompting dial-up
operations to accomplish a connection from the vendor loca-
tion L1 through the telephone system TS to the traffic control
system TIS. Standard information, as the specific buyer with
which the vendor may be entitled to schedule an appointment
may be indicated by dialed number identification signals
(DNIS) using a capability readily available from the tele-
phone system TS, as for example on the so-called D-channel.
It is to be noted that while the D-channel apparatus provides
one operational configuration, some DNIS and/or ANI (Auto-
matic Number Identification) data signals can be received
in-band without D-channel apparatus. In any event, such sig-
nals may direct or qualify communication under control of
the system TIS. It should be noted that DNIS and ANI signals
can be used for identification, whereby the control computer
CC may fetch identification data for graphic displays.

As another feature, an incoming line can be directed at
the central traffic control system, such as an “800” line to
receive calls from any telephone (pay-phone, vendor location
or the like) to prompt scheduling. For example, a call on the
“800” line may be answered by an interface or an operator to
schedule an appointment with a specific buyer or vendor. The
vendor might be specified by ANI signals when calling from
a specific vendor location. Accordingly, a vendor can simply
call the designated number from any telephone to enter the
scheduling program.

For scheduling purposes, PIN numbers (personal identifi-
cation numbers) are assigned to vendors. The PIN number
may be coded to indicate the specific organization that a
vendor is associated with. Alternatively, a database of PIN
numbers correlating to specific organizations may provide
that information. Entry of a PIN number by a vendor may
qualify a vendor for contact with a select buyer. Initiating
contact also may be controlled by a clock, for example, some
communications might be limited to the hours between 7 a.m.
and 12 p.m. Additionally, other specifications may be design-
nated for specific groups of vendors. Thus, the system may be
configured such that DNIS and ANI communication features
cross the present time with the clock, prior to answering. For
example, if the present time is between 5 p.m. and 7 p.m., only
select vendor calls are accepted. Some vendors may be
 accorded priority status allowing them to schedule appoint-
ments for select priority days, for example, Thursdays. Simi-
larly, priority status may be accorded to vendors offering
distressed merchandise at discount rates.

As described in detail below, a priority field stored in the
vendor’s cell VC (FIG. 7) may incorporate a use-rate compo-
nent, whereby extent of use by vendors may be controlled.
That is, FIG. 7 illustrates exemplary storage cells of the traffic
control system TIS, wherein information specific to each
vendor and buyer, such as the telephone number, graphic data,
merchandise codes, schedules and the like may be stored. For
example, a vendor cell VC may be accessed by the telephone
number and address to obtain information such as the vendor
PIN number, telephone number, video format and so on. In
some formats it may be desirable to designate a rating for each
vendor indicating dependability, efficiency at delivering,
credit worthiness, specific buyer organizations with which
the vendor is registered etc.

Furthermore, to indicate an established relationship, a des-
ignation indicating priority may also be stored to isolate a
particular vendor from a plurality of vendors selling similar
goods. Of course, the vendor cell VC may also indicate the
vendor’s name, any relevant personal information, the com-
pany’s name, other persons participating in a conference and
so on. Similarly, data relating to the last purchase may also be
of importance to some buyers.

With the central traffic control system TIS interacting with
a plurality of widely distributed vendors and buyers, a cross
reference number identifying transactions with other buyers
may be of importance. Moreover, a record of the buyers
available and the time limit for each buyer is also recorded.
Similarly, the priority designation or status accorded to a
vendor for any of a myriad of reasons may indicate, for
example, that a particular vendor has distressed merchandise
for sale at discount rates. Also, vendors that are not registered
may be able to obtain appointments with buyers or buyers’
assistants for predefined short periods of time, for example,
five minutes.

To ensure effective and proper directing and exchange of
traffic, for example, special offers by vendors and responses
thereto by buyers, requests for proposals from buyers and
responses thereto by vendors, or the like, merchandise codes
that apply to each wholesale vendor and wholesale buyer are
recorded. The merchandise codes, discussed in more detail
below, regulate communication and avoid information over-
load, as by providing an indication of the type of products that
each particular vendor or buyer is authorized to sell or buy.

It should be recognized that appointment schedules also
stored in vendor and buyer cells VC and BC (FIGS. 7 and 8),
respectively, may be revised and updated on site by the traffic
control system. For example, considering a situation where a
last minute cancellation or change with respect to a schedule,
special offering, request for proposal or proposal is necessary,
changes, cancellations or updates to any of these transactions
may be requested remotely by vendors and buyers alike.
Moreover, vendors or buyers may wish to add pertinent in-
formation during visual conferences (real-time) simply for stor-
age in the cells VC and BC or otherwise for subsequent
processing.

To recap, under control of the traffic control system TIS,
the dial-up public telephone system TS affords effective com-
munication between the remote locations L1-Ln and the
buyer systems BS1-BSn. Each buyer system located at a
buyer’s facility includes a telephone switch SW, through
which incoming calls are received and outgoing calls are
placed. Incoming data signals (DNIS and ANI) are passed to
the internal control computer CC to select an appropriate one
of the terminals V1-Vn to handle the call. For example, a
station V1 might be assigned to buyer Tom Jones at XYZ
Drug company, responsible for purchasing vitamins and over
the counter medications. In addition, the computer CC also
provides computer graphic signals to monitor station V1
supplementing the coupled television display, for example, to
provide a composite display of a scene at location L1 along
with appropriate graphic data. To consider the operation of
the total-system embodiment in somewhat greater detail, ref-
The computer control and interface system 28 also is connected to a clock 40 and an operator station 42. The clock 40 may control scheduling operations as explained above. For example, updates or changes to appointments, such as cancellations, may be remotely implemented (for example, via the central traffic control system) and forwarded to the appropriate buyer in a variety of ways, such as facsimile, electronic-mail, voice-mail or the like. The clock 40 may likewise monitor time limitations, as when special offerings and proposals are only valid for defined intervals of time.

With the live operator station 42, calls from vendors seeking appointments, making special offerings, or alternatively, calls from buyers seeking appointments or proposals, may be transferred to a human operator, in the event there are complications with the automatic response units or message recording equipment or in the event callers are calling from a rotary telephone. Some vendors or buyers may always prefer telephone communication with a human operator at some level.

As indicated above, flexibility to accommodate various vendor equipment configurations is an important aspect of the central traffic control system TIS and the operator terminals V1-Vn. In that regard, it should be recognized that even though only the buyer operator terminals V1-Vn are shown coupled to a format switch 41 (lower center), the central traffic control system TIS also has some form of a format switch, shown as part of the video file server. The format switch 41 selects a compatible one of analog video circuits and static video circuits (on analog communication lines) and digital video circuits (on digital communication lines) for driving one or more monitors incorporating such specific circuits. Each of the video monitors V1-Vn carry a camera CI-Cn which may variously facilitate dynamic motion images and still images. The format switch unit 41 can switch a single analog line 39 (from analog lines AL1-ALn) to couple to either videophone circuits or static video circuits or a digital line (or lines from digital lines DL1-DLn) indicated at 39a to couple to digital video circuits. Note that two lines are typically required for digital video, one for audio and one for digital data. Alternatively, the audio line may also serve as the analog line.

A video recorder (VCR) also may be provided, indicated generally at 51a, which may be set to record continuously or intermittently, to provide historical data for subsequent reference when conferring with a supervisor or refreshing the memory with respect to specific features. Alternatively, a video printer, also indicated at 51a, may be used. On receiving a request command, for example from the traffic control station TIS, the video recorder may record compressed video signals of the display images. Of course, continuous recording by the video recorder may be suspended when desired.

At locations where more than one camera is positioned, a single video recorder may be connected to the multiple cameras via a switching device to control and sequence the recordings from the cameras. A switching device such as the intelligent sequential switcher manufactured by SONY, as Model No. YS-S100, may be used to control and sequence multiple recordings. In addition, plural video recorders, such as separate video recorders for recording images transmitted on digital or analog lines may be connected.

In some instances, select frozen frames of viewings of vendor products or a specific time period of each viewing of a vendor product may be recorded on a VCR or printed using a video printer, for example two seconds (specific time period) of a twenty minute appointment for each vendor location. Such video printing may be obtained both by buyers and vendors.
 Likewise, the operator terminal V1 (or the vendor location or the central traffic control system), for example, may incorporate a standard line printer for providing a printed record of predetermined vendor communications, e.g., indicating the date, time, location, period of appointment etc. Thus, a detailed hard-copy record is available when desired.

The traffic control system TIS also includes within a memory 32 or separate therefrom, a video EDI 35 for storing the traffic control system TIS. Various related data from the memory 32. Thus, an operator may also qualify a caller (vendor).

In that regard, the terminal AT1 (vendor) simply accommodates audio and digital signals and is representative of such terminals for use to schedule appointments, as in an ARU interface. Alternatively, person-to-person communication is available through the operator station 42.

The videophone terminal VP1 is representative of such units to provide one form of audio/video communication with one of the terminals V1-Vn. During such communication, the switch 41 is actuated to activate the videophone circuits to function in cooperation with one of the monitors V1 or Vn. Thus, compatible communication is implemented for each outgoing call, utilizing data from the memory 32.

For communication with static video systems (PICASSO™ units) as represented by the terminal VS1, the switch 41 actuates the static video circuits for compatible operation of a monitor V1 or Vn. Note that particularly effective operations may involve combination formats, for example, a videophone and a static video system (likely using a single analog line). Specifically, with both of the appropriate circuits operative, the camera and the monitor V1 may function in a videophone format to accommodate effective personal communication between a buyer and a seller. Concurrently, the camera and the monitor V1 may operate in a static video format to effectively exhibit a vendor’s product. Additionally, a mouse 51 at the terminal VS1, controls a cursor in the display of the monitor V1 further enhancing interactive communication. A mouse, such as the one indicated at 51 may also be provided at the buyer terminals V1-Vn. Again, the switch 41 controls the operations to attain the compatible format.

To further illustrate the possibilities, the terminal VDI is representative of high fidelity (hi-fi) telephonic videophone systems using digital lines for higher resolution dynamic displays. As with respect to the other formats, the switch 41 selectively actuates the compatible circuits, the digital video circuits, to drive a selected combination of camera and monitor.

It may be seen that the video platforms of terminals V1-Vn offer considerable flexibility in accommodating multiple audio-video formats. Convenience is served by the multiple format capability of the camera along with the video monitor V1-Vn.

Recapitulating, the terminal V1 has been described for communication with the various equipments at locations to include a video location for display. In addition to the display, each of the terminals V1-Vn incorporates a handpiece or equivalent, and a substantial control panel that may be in the form of a telephone pad or embodied as part of a personal computer keyboard. In any event, the control panel for each terminal V1-Vn includes the current controls for an operative video format, plus dedicated controls relating to the disclosed system. In that regard, in the interest of avoiding undue complications, only a fragment of the representative panel 80 for the terminal V1 is shown in FIG. 4.

Generally the panel 80 affords considerable control, including the use of keypad tone signals (DTMF) to perform control operations at both ends of a communication. Specifically, the fragment of the panel 80 of FIG. 4 incorporates a traditional twelve-button telephone pad 82, bearing the numerals “1” through “0” along with the symbols and “#.” The designated buttons each generate a distinct DTMF signal in accordance with extensive practice, which signals are communicated to all connected terminals.

Various other specific controls are provided on the panel 80. An on-off button 84 controls outgoing audio. A toggle 86 controls the volume of incoming audio. An on-off switch 88 controls video at the terminal. A pair of toggle switches 90 and 91, respectively, control zooming and panning camera operations. A push button switch 93 serves as an interrupt for locking onto the current display (high quality freeze frame).
for closer observation or to record data and in some cases higher resolution images for closer observation at a later time, for example, by use of a video printer. In addition, another toggle switch 95 controls tilting camera operations and a push button 97 advances the freeze frame for subsequent observation or reverses it back to a dynamic display. A push button switch 99 serves to manually terminate the call. A control switch 101 regulates resolution of the display. Finally a signal lamp 103 illuminates to indicate the next appointment. Generally, by using the telephone keypad 82 on the panel 80, various control functions can be accomplished as detailed in the parent patent applications identified herein under the caption “CROSS REFERENCE TO RELATED APPLICATIONS” and incorporated herein by reference.

One form of control involves video coordination. For example, in accordance with a program, a conference might be initiated in a videophone format with the terminal V1 (FIG. 2). Accordingly, the videophone circuits are active to drive the video monitor V1. At some point, assume the conference participants decide to add a static video communication. A command of “52” in touch tones on the pad 82 (see FIG. 3) initiates a series of operations. Specifically, another line connection is established by actuating the autodialer 30 (FIG. 2), then static video circuits are actuated. At the terminal V1, the static video circuits are actuated to drive the monitor V1 that may involve another monitor or split image operation. Separate displays for dynamic and still video may be used, such that a buyer at one monitor can confer with a vendor, speaking face-to-face through the camera and that monitor, while the vendor exhibits fine details of a product on a second monitor in a still image. Of course, in sequences of such still images, views can be changed and areas highlighted with a cursor controlled by the mouse 51.

As an alternative to actuating the static video format, the conferences may elect to go digital. A command “53” from the panel 46 sets the requisite steps in motion. The autodialer 30 dials up a digital connection, then using that connection, the switch 41 actuates the digital video circuits to drive one of the monitors V1-Vn. Note that with enhanced hi-fi video communication, the assumed videophones operation and consists of a video encoder, a video decoder and an internal system controller. The format switch unit 41 is shown as coupled between a standard analog line and a line on ISDN. Upon receiving a call from a videophone unit, the format switch unit 41 selects the appropriate line, that is, the analog line. Alternatively, upon receiving a call from a high fidelity video (digital), the format switch unit 41 selects a digital line. Also, as described above, during visual communication (real-time), a buyer may make switches, e.g., from transmitting dynamic images over a single analog line to high resolution freeze frames. The high resolution freeze frames may be viewed on large 14 inch monitors. Further, the images may be manipulated from either end, to view the freeze frame image concurrently.

In the operation of the system embracing the exemplary formats as treated above and below, a record is made for billing purposes. That is, a billing memory unit BL (FIG. 1) and a standard printer (treated below) are controlled by the computer control 28, recording all transactions in relation to billing charges. Such data can be variously processed at different times. Basically, the concept involves formulating billing data, so that at least a part of the calls made to a vendor, for example, can be billed to that vendor.

Considering the dial-up telephone system 28 (FIG. 2) in somewhat greater detail, in arrangement, the inter-exchange carrier (e.g., AT&T) provides comprehensive data on calls specifying: phone number calling, phone number called, date, time, length of call (period), billing data and so on. Test or look-up operations are then performed with reference to a vendor database. Accordingly, portions of the charges (with or without mark-ups) are rebilled (with appropriate identification to the vendor). Such operations may be particularly effective in relation to “private” networks, e.g., the so-called SDN (software defined network), SDN (software defined network) which are compatible with ISDN operations, or a combination of the two service offerings (SDN with SDN). Note that AT&T’s SDN is a virtual network service which offers an organization the ability to build a private corporate network within the AT&T public network. A customized database contains information on various sites affiliated with the organization (i.e., the service organization installs a “private” network service at many different business entities) as well as features and routing information. Moreover, SDN encompasses voice, analog data, digital data and image transfer. SDN is a feature of SDN and is most often installed in conjunction with SDN. A combination of the two provides the capability of combining all the different sites for network management and billing. Note that both buyers and vendors may wish to extend the scope of the network of participants by installing at least one similar mode of video in their branches, plants and/or customers.
Essentially, coordinated with the control computer 28 in the system TIS, reapportioning and rebilling options are executed by the billing data unit utilizing storage capacity of the memory 32 or a separate billing data memory.

To this point, detailed consideration has been primarily directed to the treatment of incoming calls to the system TIS. However, as explained, certain modes involve the placement of outgoing calls under either manual control or automatic operation. Such operations next are treated in detail.

As a result of control operations, to implement a sequence of scheduled conferences, the computer control and interface system 28 (FIG. 2) at the central traffic control site or the control computer CC at the buyer site (FIG. 1) may address, for example, the memory 32 to fetch the telephone number for an outgoing call, e.g., a vendor location L1. The telephone number is supplied from the memory 32 (or a memory at the buyer location) to the control computer CC which actuates an auto dialer, similar to auto dialer 30, to provide the dial-up signals on an off-hook line provided to the dial-up telephone system TS. Typically, at the vendor location L1, a dedicated or other line for video operations will accept the communication.

As an alternative to manual calls, the system may operate under computer control to enable a sequence of appointments. During the operation, the control computer CC (FIG. 1) fetches telephone numbers for remote locations from the memory 32 (or a memory on site) in sequence, actuates the auto dialer 34 accordingly, and assigns the resulting connections as scheduled. After a session between a particular buyer and vendor has concluded, the control computer CC terminates the connection in favor of the next waiting connection. A blinking light 103 (FIG. 3) or alternatively, a graphic display of "Five more minutes for the next appointment" may be exhibited to the caller to indicate a new appointment. The operation may result in sequential displays that have been scheduled at the particular one of the terminals V1-Vn.

Different selling and buying companies may be registered with the central traffic control system TIS. At registration, central traffic control system TIS may issue an identification card with a check digit for qualification to each representative of the selling or buying company (FIG. 5). An exemplary identification card (embodied for display) is indicated at 211. For example, assume that XYZ company has four vendor representatives, all located at vendor location L1 equipped with analog capabilities only. Further assume that the telephone number for that location is (212) 555-5555. Accordingly, the traffic control system TIS may assign an identification number and store the following information under that identification number in memory: Jones, Roger, XYZ Toy Company, Analog System, Telephone number (212) 555-5555, Registered to internet with EFG Company (central station number—(310) 666-6666), no priority, IK Company (central station number—(414) 777-7777), priority with buyer no. 3. Thursday appointments may be offered to vendors with priority status. At registration, each vendor and buyer fills out a subscription form or otherwise provides the central traffic control system with specific information, such as the nature of the merchandise they are designated to sell or buy. This information may be provided with reference to an established list of merchandise codes. The designated merchandise codes assist the selectivity logic 47 in making routing determinations to avoid information overload. Similarly, vendors and buyers seeking appointments are qualified on the basis of these merchandise codes and limited to making appointments only with authorized persons.

To make an appointment, a special offering or a proposal in response to a buyer request, the vendor may initiate dial-up operations with the central traffic control system TIS. For such calls, the ARU 36 may provide voice cues to the vendor and prompt touch tone input of responses as described above. A single ARU may be used for different organizations, alternatively, different ARU’s may be used for different large organizations. The ARU’s may include voice-mail capabilities for individual buyers. After recording all the information pertaining to a special offering or proposal, the central traffic control system provides reservation or identification numbers. For example, callers may be queried via the ARU if calling to cancel an appointment or supplement a special offering or proposal. If a call is merely to cancel an appointment, the vendor would only need to enter the appointment number. Likewise, if the call is simply to report that a sale for a special offering has been consummated, the vendor may only need to enter an identification number.

Note that live operators also may take information from vendors and access the traffic control computer TIS to enter appropriate request data processed similar to the automatic features of the system in the event vendors are calling from a rotary telephone or for other reasons. Additionally, the live operators may transfer calls to an ARU to enable vendors to leave voice-mail messages.

The traffic control system TIS may provide schedule or other data to individual buyers via facsimile, either automatically or upon request. Alternatively, schedule or other data may be provided to individual buyers by downloading data onto a computer at the buyer’s location typically in batch mode overnight. Recent changes to appointments or special offerings and proposals may be displayed on the buyer’s terminal (real-time) or forwarded by electronic-mail.

At the central traffic control site, which may service numerous business entities, several audio response units (ARU) may be used in conjunction with several groups of live operators. To accommodate large numbers of calls, automatic call distributors (ACD) may be utilized to route calls where the different business entities are identified by DNIS.

It should be recognized that video recordings on specific merchandise may be stored at the video file server 37 for viewing by buyers and sales may be consummated without any visual conferences between vendors and buyers.

Also, it should be recognized that the buyer terminals disclosed herein may be used by retailers to sell products directly to the persons having units similar to the vendor units described herein in their homes. In such a scenario, ANI may be used to identify a particular household calling, and DNIS may be used to identify a particular product of interest.

As indicated above, the traffic control system TIS incorporates structure for a wide variety of communications through the dial-up telephone system TS. FIG. 5 illustrates a more specific exemplary form of the system TIS. A telephone interface T12 (upper left) accommodates a multitude of line connections to the dial-up public telephone system TS (FIGS. 1 and 2) accommodating two-way communication with various capabilities as treated above.

The interface structure T12 (FIG. 5) accommodates the placement of outgoing calls by an auto dialer T14 controlled by a computer T16 incorporating substantial memory. Auto dialers are well known in the telephone arts functioning to place calls in response to digital instructions. As the source of such digital instructions, along with others, the control computer T16 comprises a substantial computing capability, functioning to control telephonic traffic in various communication forms through the telephone interface structure T12. Traffic is controlled, both for servicing and interconnecting remote
The control computer T16 also is connected to an audio response unit T18 for vocally cueing and otherwise interfacing remote stations through the telephone interface structure T12. Again, various forms of audio response units are well known in the telephonic arts for verbalizing cues, receiving digital signals and performing some processing. In that regard, the audio response unit T18 may incorporate some dictionary capability or may rely on the control computer T16 for an extended dictionary of words to be vocalized.

The control computer T16 also is connected to receive signals from the telephone interface structure T12 through a “D” channel circuit T20. For example, the “D” channel circuit receives ANI and DNIS signals indicative of calling and called station numbers as explained above. Essentially, the “D” channel circuit T20 provides call related information to the control computer T16 in accordance with well known techniques of the telephonic arts.

Recapitulating to some extent, it may be seen that the control computer T16, along with the above-mentioned structures, has substantial capability to interface with remote terminals. However, under certain conditions, manual communication also may be desired. Accordingly, as explained above, an operator station T21 is coupled to the control T16 to accommodate a human interface. The operator station T21 may take the form of a CRT terminal with graphics display capability and various controls (FIG. 5) implemented through the control computer T16.

As indicated above, to accomplish the traffic control function, the computer T16 has substantial computing capability, specifically, for purposes of control, storage management, delivery, scheduling and interconnecting remote stations. For convenience of explanation, in FIG. 5, several operating components that could be integrated in the computer T16 are separately illustrated. Such separate illustration also facilitates the operating explanations. Specifically, separate storage capacity is illustrated in the form of a buyer-vendor storage unit T24 and a buyer-vendor/merchandise code storage unit T26. The storage units T24 and T26 are addressed by the control computer T16 to provide data that is processed along with other data to control and facilitate on-line and off-line communications between buyer and vendor terminals.

As suggested above, communication between the various vendors and buyers involves substantial control and regulation along with limitations, thus, the term traffic control is deemed appropriate. In that regard, a qualification unit T28 is coupled both to the control computer T16 and the storage units T24 and T26. Essentially, the qualification unit T28 receives identification and limitation data to qualify buyers and vendors for select individual communications. The storage unit T26 is coupled directly to the computer T16, along with a billing data memory T30 and a printer T32 for operation as mentioned above.

Summarizing the extensive treatment above, the present system variously implements both online and offline communication as between vendors and buyers. The communication is considerably enhanced by video displays. Accordingly, a video file server T34 is coupled directly to the telephone interface structure T12 and to the control computer T16. A monitor station T36 is similarly coupled, as for select time or call monitoring.

In view of the preliminary description of the structure (FIG. 5) a comprehensive explanation of the system now may be expressed by assuming particular situations and describing typical operating sequences. Accordingly, assume the structure of FIG. 5 is coupled as the traffic control system TIS in the system of FIG. 2 for controlling and regulating select communications between vendor and buyer terminals. In that regard, a system of merchandise classification is used to enhance the selectivity of communication to prevent information overload. Generally, merchandise is classified in accordance with a decimal system, somewhat equated to the channels of commerce for various goods. For example, a component of such a classification is as follows.

<table>
<thead>
<tr>
<th>Merchandise</th>
<th>Decimal Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body Treatment</td>
<td>470000</td>
</tr>
<tr>
<td>Skincare</td>
<td>471000</td>
</tr>
<tr>
<td>Sun Cream</td>
<td>471230</td>
</tr>
<tr>
<td>Prevent &amp; Protect</td>
<td>471234</td>
</tr>
<tr>
<td>Tanning</td>
<td>471235</td>
</tr>
<tr>
<td>Cream</td>
<td>471300</td>
</tr>
<tr>
<td>Moisture</td>
<td>471310</td>
</tr>
<tr>
<td>Cleansing</td>
<td>471320</td>
</tr>
<tr>
<td>Hair</td>
<td>472000</td>
</tr>
</tbody>
</table>

In accordance with the exemplary classification, "body-treatment" merchandise carries the code “470000”. More explicit classifications of such merchandise carry additional decimal indicators. For example, as indicated above, water-resistant, sun protection treatment would be identified by the code “471234”. Accordingly, entire ranges of merchandise are classified and coded to control and regulate communication traffic in accordance herewith.

Generally, preliminary inquiries, offers for sale and requests for proposals carry merchandise codes for selectively identifying potentially interested vendors or buyers. As a further element of classification, buyers or vendors also may be assigned specific codes, for example, designating a business primarily as, supermarkets, department stores, drug stores and so on.

As detailed below, the operation of the system will be treated as it regulates and controls video communication, for example, selectively between vendors and buyers, to expedite traditionally complex purchasing operations. In that regard, the embodiment treats six types of telephone calls. Specifically, primary calls are classified in accordance with the following chart.

<table>
<thead>
<tr>
<th>Type Call</th>
<th>Nature</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
<td>Vendor with special offering</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
<td>Buyer responding to special offering</td>
</tr>

Typically, calls of the various types involve some form of qualification or approval. For example, access to the system typically will be limited to qualified or registered entities.
Also, certain limitations will be imposed on such entities. For example, calls that would reveal one vendor's proposal to another vendor are inhibited. Also, it may be desirable to limit calls from buyers accessing information related to another buyer. Of course, specific forms of limitations and qualifications may be implemented depending upon specific applications. However, in accordance with the disclosed embodiment, the types of calls set out above, all involve some form of qualification. The qualifications are generally performed by the qualification unit T28 (FIG. 5) utilizing information derived from a call correlated with reference data from the storage units T24 and T26. In that regard, the logic for the qualification unit T28 may be implemented in accordance with the flow diagram of FIG. 6 as will now be considered.

In the disclosed embodiment, the qualifications for buyers and vendors are somewhat similar. Specifically, the tests for a calling vendor are:

Is the calling station registered as a vendor (or buyer)?

Can the caller give a proper PIN number (Identification Number)?

Is the vendor qualified for the designated merchandise?

Is the vendor approved for an identified buyer or buyers?

The tests for calling a buyer are quite similar. To consider the logic embodied in the qualification unit T28 (FIG. 5), reference will now be made somewhat concurrently to FIGS. 5 and 6. With the occurrence of an incoming call through the telephone interface structure T12 (FIG. 5), "D" channel signals are supplied through the circuit T20 to the control computer T16. As a result, the computer T16 addresses the buyer/vendor storage unit T24, using the call number of the originating terminal (ANI). Of course, in other applications, DNIS signals may be similarly employed. The operation is illustrated by a block T40 (FIG. 6). Addressed by the calling number, the storage unit T24 (FIG. 5) supplies representative signals indicating: first, that the calling terminal does belong to a registered buyer or seller, whether the entry is a buyer or a seller, and the identification number (PIN) for the entity. The operation of consulting the storage unit T24 or look-up table is illustrated by a query block T42 in FIG. 6.

If the calling terminal number is not located, indicating an unregistered caller, the qualification unit T28 (FIG. 5) actuates the computer T16 for appropriate control. Specifically, the audio response unit T18 may be prompted to provide a termination message or the operator station T21 may be utilized for a human interface. Such alternatives are represented in FIG. 7 by the block T44.

For calls originating from a registered terminal, the qualification unit T28 (FIG. 5) stores the pertinent data, i.e., buyer or seller and reference PIN. The operation is illustrated in FIG. 7 by the block T46.

With the determination of a properly registered calling terminal, the computer T16 actuates the audio response unit T18 providing a verbal cue for an identification number (PIN). The operation is illustrated in FIG. 7 by the query block T48. If the caller enters keypad digital information indicating an invalid PIN, or makes no entry at all, the operation again proceeds to the block T44 for termination or transfer of the call as explained above. With the entry of a valid PIN, the operation proceeds to store the personal identification number as indicated by a block T50.

The qualification unit T28 (FIG. 5) next functions in cooperation with the computer T16 driving the audio response unit T18 to cue the caller for the type of call and the merchandise code, see blocks T52 and T54 (FIG. 6) representing such operations. Although such operations are not detailed in FIG. 6, it is to be understood that improper responses or the lack of a response will transfer the process to the function of block T44, as illustrated, to terminate or transfer the call. On the contrary, if appropriate information is received, the qualification unit T28 (FIG. 5) receives and stores the requested information. Consequently, the unit T28 contains: the caller's PIN number, the call type and the merchandise codes. That data is then tested within the qualification unit T28 against reference data, in a process step as illustrated by the query block T56 in FIG. 7. The details of the test are treated in somewhat greater detail below; however, as illustrated in FIG. 7, if the tests are not successful, the process again proceeds to the termination block T44; otherwise, the process proceeds to a block T58 to implement the substantive communication of the call.

The final test of the call involves operation of the qualification unit T28 (FIG. 5) in conjunction with the storage unit T26. That is, for each buyer and vendor, the unit T26 stores merchandise codes and, in some instances, other special information. For example, typically, vendors may be denied access to certain information. For example, a vendor would not have access to the type calls: "A" (a special offering of another vendor), "D" (another vendor responding to an RFP), and so on. However, exceptions are possible and in that regard it is simply important to appreciate that special situations may be stored in the unit T26.

Returning to the routine situation, as indicated above, each buyer and vendor is associated with specific merchandise codes. In that regard, merchandise codes not only facilitate and expedite communication but additionally, charges and billing data (for storage in the memory T30) may be based on active merchandise codes for a subscriber.

Pursuing a specific example, assume a caller, identified as a vendor and otherwise qualified is pursuing the presentation of a special offering. Further assume that the calling vendor is associated only with hair products (Chart A, code 472000). However, assume that the caller identifies the "merchandise of interest" to be a water resistant sun skin product, code 471234. Thus, the identified merchandise code does not coincide with the caller's registered merchandise code. In such a case, the processing is halted with the consequence that the call is either terminated or transferred to an operator. At this stage, likely operation would involve referring the call to an operator. Thus, the qualification unit T28 concludes the test by assuring that the entity being represented by a call is authorized for access with respect to the identified codes.

Once a caller has been identified, the control computer T16 (FIG. 5) functions primarily in conjunction with the video file server T34 to implement the communication. Of course, in instances where an appointment is sought, as described in detail above, the function of the video file server T34 may be relatively nominal. Note with regard to appointments, that a caller may simply request an appointment immediately within call types "E" and "F." That is, within the concept of obtaining an appointment, a caller may simply seek to speak with a particular vendor or buyer representative immediately.

To consider the specific operations, assume that the exemplary caller is a vendor with a special offering, i.e., call type "A." As a specific example, the caller may represent a vendor entity dealing in distressed merchandise holding a considerable volume of hair shampoo packaged for women, i.e., merchandise code 472147. With the merchandise codes stored, the control computer T16 actuates the video file server T34 along with the audio response unit T18 to receive a video presentation of the merchandise, that is, the hair shampoo. Typically, the vendor will have organized the presentation prior to making the telephone call so that the merchandise can be variously demonstrated and various information including pricing etc. expressed in the video presentation. Thus,
An effective record of the video presentation is stored in the file server T34 essentially in the form of a sales presentation for the hair shampoo, that is, product code "472147".

With the completion of the video record, the control computer T16 actuates the storage unit T26 to isolate all buyers associated with the product code "472147" identifying hair shampoo. With the list of buyers identified and a video presentation recorded, the subsequent operations involve communicating the video presentation to the select group of buyers. In accordance with the disclosed embodiment, the identified buyer group is notified of the availability of the demonstration. Thereafter, qualified buyers may establish communication (call "B") through the telephone interface structure T12 (FIG. 5) to receive the stored video presentation from the file server T34. Various specific arrangements may be involved. The central traffic system may maintain a record or log of all the buyers accessing the video file server, which may be provided to the vendor, upon request. A record of the time (provided by the clock) spent by each buyer in viewing a video presentation may also be maintained. For example, a specific buyer may terminate the video after viewing it for only a few minutes, while another buyer may view the entire video presentation. The vendor may request such information to determine buyers' reactions to the special offering, for marketing or other reasons.

In some situations, it may be particularly advantageous for buyers to receive early notice of a special offering by a vendor. Accordingly, it may be desirable to implement a rotational order scheme or a random operation for determining the sequence in notifying buyers. Specifically, a random number generator may be incorporated in the control computer T16 for ordering the list of buyers for notification.

Notices to buyers or vendors also may vary considerably, depending upon individual programming considerations. In some situations, vendors may provide a special list of buyers or alternatively, exclude specific buyers. All buyers and vendors are provided with a list of participating members of the network, at registration. Periodic updates of new members may be circulated from time to time.

In accordance with the disclosed embodiment, the control computer T16 simply actuates the auto dialer T14 to establish telephonic communication with buyers after which the audio response unit T18 notifies the buyer. Alternatives involve the utilization of facsimile or the like capability or various forms of electronic mail may be incorporated for utilization. In any event, the select group of buyers is notified that the presentation on a hair shampoo packaged for women is accessible by contacting the telephone structure T12. Responding buyers (call type "B") are qualified as described above, then coupled to the video file server T34 to receive the video presentation. Thereafter, interested buyers may directly contact the vendor, typically, for further video communication. Thus, the foundation for a transaction is completed rapidly and effectively with substantial communication of the goods involved and related considerations.

Another possibility involves type "C" calls, whereby a buyer distributes a request for proposal. Again, various communications may be accomplished to a select group or subgroup of vendors based on merchandise codes. To consider a specific form of communication in accordance herewith, after qualification, a buyer might use video communication to notify vendors with a graphic such as one illustrated in FIG. 9. FIG. 9 illustrates an exemplary buyer request form providing specific information of the merchandise. Blank forms may be stored in a forms directory (e.g. menu-driven) or the like on each buyer terminal. Thus, when making a request for proposals, a buyer may simply access a blank form and enter the specific information. Essentially, a merchandise code number "472361" is supplied, indicating the specific product as also identified in the graphic. After the notice has been sent to vendors, a message as represented in FIG. 10 may be transmitted to the buyer from the central traffic control system TIS. Note that a check digit may be supplied. Likewise, vendors may access blank forms, similar to the exemplary buyer request forms, to indicate special offerings.

Following receipt of a request for proposal, interested vendors may submit a video presentation as described above. Alternatively, vendors may be invited to call for an appointment or otherwise communicate their proposals to buyers. Thus, the system affords considerable flexibility in selectively communicating product information between buyers and sellers using video formats.

In view of the above description, it will be apparent that numerous operating formats, programs and layouts may be accomplished using a wide variety of videophone equipment in cooperation with computing and telephone apparatus. As indicated above, the disclosed embodiments afford some arrangements; however, the scope hereof should not so confined, rather the scope hereof should be in accordance with the claims as set forth below.

What is claimed is:
1. A process, utilizing one or more multiple coordinated central control stations linked for communication with buyers or vendors located at widely distributed locations, for controlling buyer and vendor communication via public data communication links, comprising the steps of:
   a. notifying, via the one or more central control stations, one or more buyers, at personal computers with video capability utilized by the buyers, regarding an offer from a vendor, interfacing one or more buyers, via control by the one or more multiple coordinated central control stations, to provide a presentation including video data and text data relating to the offer from the vendor to the buyers at the buyer personal computers, the video data including high resolution video including high resolution still images, the buyers having a capability associated with the personal computers to alter the video data;
   b. receiving, via control by the one or more multiple coordinated central control stations, identification data from the buyers, wherein the identification data is verified before the one or more buyers receive at least a portion of the presentation at the buyer personal computers; and following a transaction between the buyers and the vendor relating to the offer, facilitating communication with the buyer regarding the transaction via electronic mail sent under control of the one or more multiple coordinated central control stations.
2. A process according to claim 1, wherein the video data includes dynamic video.
3. A process according to claim 1, further comprising the step of:
   a. receiving, an indication from the buyer of the maximum amount that a buyer is willing to pay for the vendor's offer.
4. A process according to claim 1, wherein the capability is associated with the personal computer used by the buyers to highlight areas of the video data.
5. A process according to claim 1, wherein the multiple coordinated central control stations have the capability to route the buyer and the vendor communication to each other.
6. A process according to claim 1, wherein the video data further comprises voice data.
A process according to claim 1, wherein the identification data includes a check digit.

A process according to claim 1, wherein the step of notifying further comprises the step of downloading data relating to the offer on a buyer's personal computer.

A process according to claim 1, wherein the step of notifying is accomplished by facsimile.

A process according to claim 1, wherein the step of notifying is accomplished by a public communication system, comprising the steps of: receiving identification data provided by the buyers from another remote terminal.

A process according to claim 1, further comprising the step of: receiving additional data relating to the area of interest entered by the buyers to indicate an area of interest indicative of a particular merchandise or service;

A method according to claim 13, wherein the identification data contains a check digit.

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and the multiple coordinated central control stations based on the area of interest data.

A process according to claim 1, further comprising the step of: receiving request data from the certain buyers, at the database, to the one or more multiple coordinated control systems, for each buyer relating to transactions initiated by buyers while the buyers are interfaced with the one or more multiple coordinated control systems;

A method according to claim 13, further comprising the step of: providing the capability associated with the personal computers configured to enable buyers to alter the video data entered by the buyers to indicate an area of interest concerning a merchandise or a service, the request data also including an indication of the maximum amount the buyers are willing to pay for the merchandise or service;

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and the central control stations based on the area of interest data.

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the source relating to the one or more vendors during the course of an interface between buyers and the central control stations based on the area of interest data.

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and the multiple coordinated central control stations based on the area of interest data.

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and the multiple coordinated central control stations based on the area of interest data.

A method according to claim 13, further comprising the step of: providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and the central control stations located at one or more plural sites to facilitate interactive data sharing with one or more widely distributed vendors, through a communication network, comprising the steps of: interfacing at least certain buyers with at least one of the multiple coordinated control systems to communicate with the one or more widely distributed vendors; receiving request data from the certain buyers, at the at least one or more multiple coordinated control systems, the request data entered by the buyers to indicate an area of interest indicative of a particular merchandise or service;

A method according to claim 13, further comprising the step of: receiving identification data for the originating remote terminal with video capability for at least one of the buyers via the one or more multiple coordinated control systems when the buyer is in communication with the one or more multiple coordinated control systems; storing at least a part of the request data from the buyers at the one or more multiple coordinated control systems and using at least a part of the request data to selectively obtain proposed data from the one or more widely distributed vendors responsive to the request data provided by the buyers;

A method according to claim 13, further comprising the step of: providing access by the buyers under control of the one or more multiple coordinated control systems to a video memory device for conveying one or more video images including at least high resolution still images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to the one or more vendors for subsequent viewing by interested buyers;

A method according to claim 13, further comprising the step of: also storing via the one or more multiple coordinated central control stations, data for each buyer relating to transactions initiated by interfaced buyers.

A method according to claim 13, wherein access to the video data is provided according to a priority status.

A method according to claim 17, wherein access is provided in accordance with a rotational order.

A method according to claim 17, wherein access is provided in accordance with a random order.

A method according to claim 17, wherein the identification data includes data provided by at least one of the buyers.
22. A method according to claim 17, wherein the identification data includes automatic identification data provided for the remote terminal with video capability by the communication network.

23. A method according to claim 17, wherein automatic identification data includes ANI.

24. A method according to claim 17, further comprising the step of:

- providing video data from one or more memory sites associated with a vendor during the course of an interface between buyers and the one or more multiple coordinated control systems based on the area of interest data.

25. A method according to claim 17, further comprising the step of:

- providing a control device associated with the remote terminals including personal computers, the control device configured to enable buyers to alter the video data and an associated capability to capture at least one of the video images and to transmit a captured video image to another remote terminal.

26. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control systems to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more vendors with a capability to electronically communicate through a public communication system, comprising the steps of:

- interfacing the buyers with the one or more multiple coordinated central control stations in communication with one or more vendors, through the public communication system wherein at least certain buyers electronically communicate with the one or more multiple coordinated central control stations;

- receiving request data from the buyers, via the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;

- receiving identification data provided by the buyers from the remote video terminals including personal computers with video capability, the multiple coordinated central control systems in communication with one or more vendors with a capability to electronically communicate through a public communication system, comprising the steps of:

  - storing at least a part of the request data from the buyers via the one or more multiple coordinated central control stations and using at least a part of it to selectively obtain proposed data from the one or more vendors responsive to the buyers’ request data;

  - providing access by the buyers under control of the one or more central control stations to a video memory for conveying one or more high resolution video images and text data related to the video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to the vendors for subsequent viewing by interested buyers;

  - also storing via the one or more multiple coordinated central control stations, data relating to transactions initiated by the interfaced buyers;

  - electronically transmitting data relating to the transaction initiated after an interface between the interfaced buyers and the one or more multiple coordinated central control stations is terminated including a number identifying the transaction; and facilitating access by the buyers to various different vendors under control of the one or more multiple coordinated central control stations while interfaced.

27. A method according to claim 26, wherein each vendor has its own video storage device for storing video data.

28. A method according to claim 26, wherein automatic identification data provided access to the video data according to a priority status.

29. A method according to claim 26, wherein buyers are provided access to the video data according to a priority status.

30. A method according to claim 26, wherein access is provided in accordance with a rotational order.

31. A method according to claim 26, wherein access is provided in accordance with a random order.

32. A method according to claim 26, further comprising the step of:

- providing video data from one or more memory sites associated with the one or more vendors during the course of an interface between buyers and the multiple coordinated central control systems based on the area of interest data.

33. A method according to claim 26, further comprising the step of:

- providing a control device associated with the remote video terminals, including personal computers, the control device configured to enable buyers to alter the video data and an associated capability to capture at least one of the video images and transmit a captured video image to another remote terminal.

34. A method according to claim 26, further comprising a step of:

- storing via the one or more multiple coordinated control systems, a log of the buyers, the identification data of the buyers, and the area of interest provided by the buyers.

35. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more central control stations, buyers at a plurality of remote locations using remote video terminals including personal computers with video capability, the one or more coordinated central control stations in communication with one or more vendors with a capability to electronically communicate through a communication network, comprising the steps of:

- registering the buyers and vendors with the one or more multiple coordinated central control stations prior to facilitating at least certain electronic communications;

- interfacing the buyers with the one or more multiple coordinated central control stations in communication with one or more vendors, through the communication network wherein at least certain buyers electronically communicate with the one or more multiple coordinated central control stations;

- receiving request data from the buyers, via the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;

- receiving identification data provided from the originating remote video terminals via the one or more multiple coordinated central control stations;
storing at least a part of the request data from the buyers via the one or more multiple coordinated central control stations and using at least a part of it to selectively obtain proposed data from the one or more vendors responsive to the buyers' request data;

- providing access by the buyers under control of the one or more multiple coordinated central control stations to a video memory for conveying one or more video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to the one or more vendors for subsequent viewing by interested buyers; and
- electronically transmitting by electronic mail, data relating to the transaction including a number identifying the transaction, after an interface between the interfaced buyer and the one or more multiple coordinated central control stations is terminated.

36. A method according to claim 35, wherein buyer access is provided to the one or more video data according to a priority status.

37. A method according to claim 35, wherein buyer access is provided in accordance with a rotational order.

38. A method according to claim 35, wherein buyer access is provided in accordance with a random order.

39. A method according to claim 35, wherein the identification data includes data provided by the buyers.

40. A method according to claim 35, wherein the identification data includes automatic identification data provided by the communication network.

41. A process according to claim 35, further comprising the step of:

- providing video data from one or more memory sites associated with the one or more vendors during the course of an interface between buyers and the one or more multiple coordinated central control stations based on the area of interest data.

42. A process according to claim 35, further comprising the step of:

- providing a control device associated with the remote video terminals including personal computers configured to enable buyers to alter the video data and an associated capability to capture at least one of the video images and transmit a captured video image to another remote video terminal.

43. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control systems to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more central control stations, buyers at a plurality of remote locations using remote video terminals including personal computers with video capability, the one or more multiple coordinated central control systems in communication with one or more vendors with a capability to electronically communicate through a communication network, comprising the steps of:

- registering the buyers or vendors or both via the one or more multiple coordinated central control stations prior to facilitating electronic communications wherein the buyers or the vendors or both provide data to facilitate subsequent electronic communications;
- designating an originating terminal identification number for use in subsequent electronic communications; and
- interfacing the buyers with the one or more multiple coordinated central control stations to communicate with one or more vendors;

- receiving request data from the buyers, via the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;

- receiving identification data provided by buyers from the remote video terminals via the one or more multiple coordinated central control stations when the buyers are interfaced with the one or more multiple coordinated central control systems;

- storing at least a part of the request data from the buyers at the one or more multiple coordinated central control stations and using at least a part of it to selectively obtain proposed data from the one or more vendors responsive to the buyers' request data;

- providing access by the buyers under control of the one or more multiple coordinated central control stations to a video memory for conveying one or more high resolution video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to the vendors for subsequent viewing by interested buyers; and

- electronically transmitting data relating to the transaction initiated after an interface between the interfaced buyer and the one or more central control stations is terminated including a number identifying the transaction.

44. A method according to claim 43, wherein buyers are provided access to the video images according to a priority status.

45. A method according to claim 43, wherein buyer access is provided in accordance with a rotational order.

46. A method according to claim 43, wherein buyer access is provided in accordance with a random order.

47. A method according to claim 43, wherein the step of receiving request data further includes receiving an item number.

48. A method according to claim 43, further comprising the step of:

- providing video data from one or more memory sites associated with the one or more vendors during the course of an interface between buyers and the one or more central control stations based on the area of interest data.

49. A process according to claim 43, further comprising the step of:

- providing a control device associated with the personal computers configured to enable buyers to alter the video data and use an associated capability to capture at least one of the video images and transmit a captured video image to another remote video terminal.

50. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more central control stations, buyers at a plurality of remote locations using personal computers with video capability, the one or more multiple coordinated central control stations in communication with one or more vendors with a capability to electronically communicate through a communication network, comprising the steps of:
interfacing the buyers with the one or more multiple coordinated central control stations in communication with one or more vendors, through the communication network wherein at least certain buyers electronically communicate with the one or more multiple coordinated central control stations;

receiving request data from the buyers, at the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;

receiving identification data provided by buyers from the personal computers via the one or more multiple coordinated central control stations when the buyers are in communication with the one or more vendors;

storing at least a part of the request data from the buyers at the one or more multiple coordinated central control stations and using at least a part of it to selectively obtain proposed data from the vendor responsive to the buyers’ request data;

checking the identification data provided by the buyers before providing at least some access by the buyers under control of the one or more multiple coordinated central control stations to a video memory for conveying one or more high resolution video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to one or more vendors for subsequent viewing by interested buyers;

also storing via the one or more multiple coordinated central control stations, data relating to transactions initiated by interfaced buyers; and electronically transmitting data relating to the transaction initiated after an interface between the interfaced buyer and the one or more multiple coordinated central control stations is terminated including a number identifying the transaction.

51. A method according to claim 50, further comprising the step of:

providing video data from one or more memory sites associated with the one or more vendors during the course of an interface between buyers and the one or more multiple coordinated central control stations based on the area of interest data.

52. A method according to claim 50, further comprising the step of:

providing a control device associated with the personal computers configured to enable buyers to alter the video data and use an associated capability to capture at least one of the video images and transmit a captured video image to another remote terminal.

53. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more multiple coordinated central control stations, buyers at a plurality of remote locations using personal computers with video capability, one or more vendors in communication with the one or more multiple coordinated central control stations with a capability to electronically communicate through a public communication system, comprising the steps of:

interfacing the buyers with the one or more central control stations in communication with one or more vendors, through the public communication system;

receiving request data from the buyers, at the one or more central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;

receiving identification data provided by buyers from the personal computer via the one or more central control stations;

storing at least a part of the request data from the buyers via the one or more central control stations and using at least a part of it to selectively obtain proposed data from the one or more vendors responsive to the buyers’ request data;

providing access by the buyers under control of the one or more central control stations to a video memory for conveying one or more high resolution video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to one or more vendors for subsequent viewing by interested buyers;

also storing via the one or more central control stations, data relating to transactions initiated by interfaced buyers;

electronically transmitting data relating to the transaction including a number identifying the transaction after an interface between the interfaced buyer and the one or more central control stations is terminated; and providing an additional identification number relating to the merchandise code following the receipt of the request data from the buyers.

54. A method according to claim 53, wherein in addition to transmitting an identification number, also transmitting additional data relating to the merchandise code.

55. A method according to claim 53, further comprising the step of:

providing video data from one or more memory sites associated with the one or more vendors during the course of an interface between buyers and the one or more multiple coordinated central control stations based on the area of interest data.

56. A method according to claim 53, further comprising the step of:

providing a control device associated with the personal computers configured to enable buyers to alter the video data and use an associated capability to capture at least one of the video images and transmit a captured video image to another remote terminal.

57. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selectively interfacing under control of the one or more multiple coordinated computers, buyers at a plurality of remote locations using personal central computers with video capability, the one or more multiple coordinated computers in communication with one or more vendors with a capability to electronically communicate through a public communication network, comprising the steps of:

interfacing the buyers with the one or more multiple coordinated central control stations in communication with one or more vendors, through the public communication network wherein at least certain buyers electronically communicate with the one or more multiple coordinated central control stations;

receiving request data from the buyers, at the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data
A method involving selectively interfacing under control of the
central control stations to accomplish transactions that
remote locations using personal computers with video capa­
communications under control of one or more multiple coordi­
communication system, comprising the steps of:

- providing a control device associated with the personal
  computers configured to enable buyers to alter the video
  data and use an associated capability to capture at least
  one of the video images and transmit a captured video
  image to another remote terminal.

- providing a control device associated with the personal
  computers configured to enable buyers to alter the video
  data and use an associated capability to capture at least
  one of the video images and transmit a captured video
  image to another remote terminal.

- receiving request data from the buyers, via the one or more
  multiple coordinated central control stations in commu­
  nication with the one or more vendors, the request data
  entered by the buyers to indicate an area of interest
  concerning the merchandise or the service;

- receiving identification data provided by buyers from the
  personal computers via the one or more multiple coor­
ed control stations;

- storing at least a part of the request data from the buyers via
  the one or more multiple coordinated central control
  stations and using at least a part of it via the one or more
  multiple coordinated central control stations to selec­
tively obtain proposed data from the vendor responsive to
the buyers’ request data;

- providing access by the buyers under control of the one or
  more multiple coordinated central control stations to a
  video memory for conveying one or more high resolu­tion
  video images as part of the proposed data relating to
  the area of interest indicated by the buyers, the video
  images previously obtained from a source relating to one
  or more vendors for subsequent viewing by interested
  buyers;

- facilitating manipulation by the buyer of the video images
  including stored dynamic video or stored high resolution
  still image via a control device;

- also storing via the one or more central control stations,
data relating to transactions initiated by interfaced buyers;

- electronically transmitting data relating to the transaction
  initiated after an interface between the interfaced buyer
  and the one or more multiple coordinated central control
  stations is terminated.

58. A method according to claim 57, wherein buyers are
provided access to the video images according to a priority
status.

59. A method according to claim 57, wherein buyer access is
provided in accordance with a rotational order.

60. A method according to claim 57, wherein buyer access is
provided in accordance with a random order.

61. A method according to claim 57, wherein the record of
charges is maintained and provided upon request.

62. A method according to claim 57, further comprising the
step of:
- providing video data from one or more memory sites asso­
ciated with the one or more vendors during the course of
an interface between buyers and the one or more central
control stations based on the area of interest data.

63. A method according to claim 57, further comprising the
step of:
- providing a control device associated with the personal
  computers configured to enable buyers to alter the video
  data and use an associated capability to capture at least
  one of the video images and transmit a captured video
  image to another remote terminal.

64. A method for directing and exchanging on-line com­
 munications under control of one or more multiple coordi­
nated central control stations to accomplish transactions that
relate to merchandise or a service available for purchase, the
method involving selectively interfacing under control of the
one or more central control stations, buyers at a plurality of
remote locations using personal computers with video capa­
bility, the one or more multiple coordinated central control
stations in communication with one or more vendors with a
capability to electronically communicate through a public
communication system, comprising the steps of:

- interfacing the buyers with the one or more multiple coor­
dinated central control stations in communication with
one or more vendors, through the public communication
system;

- receiving request data from the buyers at the one or more
  multiple coordinated central control stations, the request

65. A method according to claim 64, further comprising the
step of:
- also storing via the one or more multiple coordinated cen­
tral control stations, billing data including a record of
charges incurred for each buyer relating to transactions
initiated by interfaced buyers.

66. A method according to claim 64, further comprising the
step of:
- providing video data from one or more memory sites asso­
ciated with the one or more vendors during the course of
an interface between buyers and the one or more mul­
tiple coordinated central control stations based on the
area of interest data.

67. A method according to claim 64, further comprising the
step of:
- providing a control device associated with the personal
  computers configured to enable buyers to alter the video
  data and use an associated capability to capture at least
  one of the video images and transmit a captured video
  image to another remote terminal.

68. A method for directing and exchanging on-line com­
 munications under control of one or more multiple coordi­
nated central control stations to accomplish communications that
relate to merchandise or a service, the method involving
selective interfacing of buyers at a plurality of remote loca­
tions using remote terminals with video capability, the one or
more multiple coordinated central control stations in commu­
nication with one or more vendors with a capability to elec­
tronically communicate, under control of the one or more
multiple coordinated central control stations, through a pub­
lic communication system, the one or more of multiple coor­
dinated central control stations located at one or more plural
sites, the method comprising the steps of:

- interfacing at least certain buyers with the one or more
  multiple coordinated central control stations to selec­
tively obtain proposed data from the vendor responsive to
the buyers’ request data;

- providing access by the buyers under control of the one or
  more multiple coordinated central control stations to a
  video memory for conveying one or more high resolu­tion
  video images as part of the proposed data relating to
  the area of interest indicated by the buyers, the video
  images previously obtained from a source relating to one
  or more vendors for subsequent viewing by interested
  buyers;

- facilitating manipulation by the buyer of the video images
  including stored dynamic video or stored high resolution
  still image via a control device;

- also storing via the one or more multiple coordinated cen­
tral control stations, billing data including a record of
charges incurred for each buyer relating to transactions
initiated by interfaced buyers.

- electronically transmitting data relating to the transaction
  including a number identifying the transaction after an
  interface between the interfaced buyer and the one or
  more multiple coordinated central control stations is
  terminated.
data entered by the buyers to indicate an area of interest on a particular merchandise or service;
receiving identification data provided by buyers from the remote terminals via the one or more multiple coordinated central control stations;
storing at least a part of the request data from at least one of the certain buyers via the one or more multiple coordinated central control stations and using at least a part of the request data to selectively obtain proposed data from the one or more vendors responsive to the buyers’ request data, the one or more multiple coordinated central control stations providing the proposed data from the vendors to the buyers in accordance with at least certain stored priority designations previously accorded to the vendors and executed by the one or more multiple coordinated central control stations;
providing access by the buyers under control of the one or more multiple coordinated central control stations to a video memory wherein the video memory is configured to provide video data including dynamic video images or high resolution still images as part of the proposed data relating to the area of interest indicated by the buyers, the dynamic video images or high resolution still images or both previously obtained from a source relating to one or more vendors for subsequent viewing by interested buyers; and
providing a control device associated with the personal computer configured to enable buyers to alter the video data and providing an associated capability to capture at least one of the video images and transmit a captured video image to another remote terminal.

69. A method according to claim 68, wherein buyers are provided access to the video data according to a priority status.

70. A method according to claim 68, wherein buyer access is provided in accordance with a rotational order.

71. A method according to claim 68, wherein buyer access is provided in accordance with a random order.

72. A method according to claim 68, further comprising the step of:
providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and one or more vendors based on the area of interest data.

73. A method according to claim 68, further comprising the step of:
assigning PIN numbers vendors, wherein the PIN numbers are coded to indicate the specific organization that a vendor is associated with.

74. A method for directing and exchanging on-line communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service available for purchase, the method involving selective interfacing of buyers at a plurality of remote locations using personal computers with video capability, the one or more multiple coordinated central control stations in communication with one or more vendors with a capability to electronically communicate, under control of the one or more central control stations, through a public communication system, the one or more of multiple coordinated one or more central control stations located at one or more plural sites, the method comprising the steps of:
interfacing at least certain buyers with the one or more multiple coordinated central control stations to communicate with one or more widely distributed vendors;
receiving request data from the buyers at the at least one or more multiple coordinated central control stations, the request data entered by the buyers to indicate an area of interest on a particular merchandise or service;
receiving identification data provided by buyers from the remote locations via the one or more central control stations;
storing at least a part of the request data from at least one buyer at the one or more multiple coordinated central control stations and using at least a part of the request data to selectively obtain proposed data from the vendors responsive to the buyers’ request data, the one or more multiple coordinated central control stations providing the proposed data from the vendors to the buyers in accordance with stored priority designations previously accorded to at least certain of the vendors under control of the one or more multiple coordinated central control stations;
providing access by the buyers under control of the one or more multiple coordinated central control stations to a video memory for providing stored video including one or more dynamic or high resolution still video images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to one or more vendors and stored for subsequent viewing by interested buyers; and
facilitating manipulation by the buyer of the stored video data whereby the buyer can use a mouse associated with the personal computers to change the video images or highlight select areas with a cursor controlled by the mouse.

75. A method according to claim 74, wherein buyers are provided access to the video data according to a priority status.

76. A method according to claim 74, wherein buyers are provided access to the video data in accordance with a rotational order.

77. A method according to claim 74, wherein buyers are provided access to the video data in accordance with a random order.

78. A method according to claim 74, further comprising the step of:
providing video data from one or more memory sites associated with the vendors during the course of an interface between buyers and one or more vendors based on the area of interest data.

79. A method according to claim 74, further comprising the step of:
providing a control device associated with each of the personal computers configured to enable buyers to alter the video data and an associated capability to capture at least one of the video images and transmit a captured video image to another remote terminal.

80. A method for directing and exchanging communications under control of one or more multiple coordinated central control stations to accomplish transactions that relate to merchandise or a service, the one or more multiple coordinated central control stations linking via a communication network buyers at a plurality of remote locations using personal computers with video capability, the one or more multiple coordinated central control stations in communication with one or more vendors with a capability to electronically provide data comprising the steps of:
receiving request data from the buyers, via the one or more multiple coordinated central control stations in communication with the one or more vendors, the request data entered by the buyers to indicate an area of interest concerning the merchandise or the service;
receiving identification data provided by buyers from the remote locations via the one or more multiple coordinated central control stations when the buyers are in communication with the vendors;

storing at least a part of the request data from the buyers via the one or more multiple coordinated central control stations and using at least a part of it to selectively obtain proposed data from a vendor responsive to the buyers' request data;

providing access by the buyers under control of the one or more multiple coordinated central control stations to a video memory for providing one or more video images including dynamic video or high resolution still images as part of the proposed data relating to the area of interest indicated by the buyers, the video images previously obtained from a source relating to one or more vendors for subsequent viewing by interested buyers;

facilitating manipulation by the buyer of the stored video data including stored dynamic video or stored high resolution still image via a control device; and

electronically transmitting data relating to the transaction initiated after an interface between the interfaced buyer and the one or more multiple coordinated central control stations is terminated.

81. A method according to claim 80, further comprising the step of:

also storing via the one or more multiple coordinated central control stations, record data including a log of buyers accessing the video memory including an amount of time spent by at least certain buyers to view any stored video data, the record data provided by a vendor upon request.

82. A method according to claim 80 wherein the data relating to the transaction relates to item number data.

83. A method according to claim 80, further comprising the step of:

providing access to various different memory sites associated with the one or more vendors during the course of an interface between buyers and the one or more multiple coordinated central control stations based on the area of interest data.

84. A method according to claim 80, further comprising the step of:

providing a control device associated with the personal computers configured to enable buyers to manipulate the control device and to capture at least one of the video images with an associated capability and transmit a captured video image to another remote terminal.

85. A method for directing and exchanging on-line communications under control of a control system to accomplish communications that relate to merchandise or a service, the method involving selective interfacing of buyers at a plurality of remote locations using remote terminals with video capability, the control system in communication with one or more vendors with a capability to electronically communicate, under control of the control system, through a public communication system, the communication control system comprising one or more of multiple coordinated communication control systems located at one or more plural sites, the method comprising the steps of:

receiving identification data provided from remote terminals by the buyers via the control system;

maintaining a record of at least certain buyer communications with the control system;

notifying buyers under control of the control system in accordance with a rotational order operation or a random operation of availability of select merchandise or services for purchase based on an area of interest stored for the buyers;

interfacing at least certain buyers with the control system to communicate with one or more widely distributed vendors; and

using the area of interest stored for the buyers to selectively obtain proposed data from the one or more widely distributed vendors responsive to the area of interest, the control system providing the proposed data including video image data from at least certain of the vendors to the buyers in accordance with stored priority designations previously accorded to the vendors and executed by the control system.

86. A method according to claim 85, wherein buyers are provided access to the video data according to a priority status.

87. A method according to claim 85, further comprising the step of:

providing access to various different memory sites associated with the vendor during the course of an interface between buyers and one or more vendors based on the area of interest data.

88. A method according to claim 85, further comprising the step of:

providing a control device associated with the remote terminals configured to enable buyers to manipulate the control device and to capture at least one of the video images with an associated capability and transmit a captured video image to another remote terminal.

89. A method according to claim 85, wherein the identification data is provided by registering via the control system.

90. A method according to claim 85, wherein the area of interest is indicated via blank forms accessed via a menu.

91. A method according to claim 85, further comprising the step of:

routing communication between the one or more multiple coordinated communication control systems.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Column 26, line 46, claim 17, after “systems,” insert --data--.

Column 32, line 38, claim 55, after “the” delete the first “one or more”.

Column 32, line 54, claim 57, after “personal” delete “central”.

Column 35, line 47, claim 73, after “assigning PIN numbers” insert --to--.

Column 37, line 46, claim 84, change “captures” to “capture”.

Signed and Sealed this Twenty-eighth Day of June, 2011
