This invention relates to an electronic means by which people can select the exact seat or seats they want for any type of event or reserve an appointment for any activity. More specifically, a customer or a ticket re-seller or a venue operator can go, for example, to the internet and select the event or activity for which he wants a ticket or tickets or reserve a time and reserve and order the exact seat or seats or the time of his choosing directly online. The seat or seats or reserved time he selects is then removed from the inventory for that activity or event and made not available for any other buyer and such is so indicated by a graphical representation or other such indicator on the online map or picture representing availability of seating or time for that event.

* cited by examiner
1. A VENUE OPERATOR IMPLEMENTS THE INSTANT INVENTION FOR HIS USE AS HIS OWN TICKETING AND RESERVATION SYSTEM.

2. THAT SPECIFIC VENUE IS RECORDED, CODED AND PLACED ON A SERVER CONNECTED CONVENTIONALLY TO THE INTERNET OR ANY SUCH WIDE AREA NETWORK.

3. A PROSPECTIVE CUSTOMER FOR TICKETS TO ANY EVENT LOGS ONTO THE INTERNET, OR OTHER SUCH WIDE AREA NETWORK, IN HIS CONVENTIONAL MANNER, WHETHER FROM HOME OR OFFICE OR ANY REMOTE LOCATION.

4. SAID PROSPECTIVE CUSTOMER ATTACHES TO THE SERVER THROUGH ANY CONVENTIONAL GRAPHICAL BROWSING MEANS AND VIEWS THE AVAILABLE VENUES, PERFORMANCES, DATES, AND/OR OTHER SUCH OFFERINGS.

5. UPON FIRST ACCESS AN INQUIRY IS MADE TO THE APPROPRIATE DATABASE ASKING FOR A RETURN TO THE PROSPECTIVE CUSTOMER OF ALL GENERALIZED INFORMATION AVAILABLE FROM WHICH HE WILL MAKE A SELECTION OF THE TYPE OF VENUE HE IS SEEKING.

6. SAID PROSPECTIVE CUSTOMER SELECTS A SPECIFIC AREA OF INTEREST FROM THE AVAILABLE VENUES, SUCH MAY BE THEATER TICKETS FOR A PARTICULAR SHOW DATE, AIRLINE SEATS FOR A GIVEN FLIGHT, ETC., AND INDICATES HIS SELECTION THROUGH A CONVENTIONAL HYPERLINK OR OTHER COMPATIBLE MEANS.

7. UPON CONTACT THE SERVER MAKES ANOTHER APPROPRIATE DATABASE QUERY ASKING FOR A RETURN TO THE PROSPECTIVE CUSTOMER OF ALL SPECIFIC INFORMATION RELATING TO HIS SELECTION, I.E., AVAILABLE SEATS FOR THE CHOSEN AIRLINE FLIGHT FROM WHICH HE WILL MAKE HIS SELECTION OR SELECTIONS.

8. UPON RETURN THE PROSPECTIVE CUSTOMER IS PRESENTED WITH A REPRESENTATION OF ALL AVAILABLE SEATING FOR HIS SELECTED VENUE. FROM THIS REPRESENTATION, WHICH MAY BE GRAPHICAL OR DISPLAYED IN ANY OTHER APPROPRIATE WAY HE MAKES A SELECTION OF THE SPECIFIC SEAT OR SEATS HE WISHES TO RESERVE AND SUBMITS SUCH TO THE SERVER.

9. THE SERVER CREATES A TEMPORARY CUSTOMER IDENTIFICATION AND ASSOCIATES THE PROSPECTIVE CUSTOMER'S SELECTIONS WITH THAT SPECIFIC IDENTIFICATION SO AS TO PRECLUDE CONFUSION AND ALLOW MULTIPLE SIMULTANEOUS USERS.

10. THE SERVER REQUESTS PAYMENT INFORMATION FROM THE NOW CUSTOMER THROUGH A FORM INPUT MECHANISM. ONCE COMPLETED AND SUBMITTED, THE CUSTOMER'S PAYMENT INFORMATION IS VERIFIED SO AS TO PRECLUDE CONFUSION AND ALLOW MULTIPLE SIMULTANEOUS USERS.

11(A). IF CUSTOMER'S PAYMENT INFORMATION VERIFICATION IS SUCCESSFUL THEN:
(A) THE CUSTOMER'S INFORMATION, AS SUPPLIED IN STEP 10, IS MADE PERMANENT AND;
(B) THOSE SPECIFIC SEATS AS SELECTED BY THE CUSTOMER ARE REMOVED FROM AVAILABLE INVENTORY AND;
(C) MARKED AS UNAVAILABLE ON THE GRAPHICAL REPRESENTATION OF THE VENUE SEATING AS PRESENTED TO THE NEXT PROSPECTIVE CUSTOMER;
(D) ENTERED INTO THE ACCOUNTING AND ADMINISTRATION INFORMATION DATABASE FOR LATER RETRIEVAL BY THE VENUE OPERATOR.

11(B). IF CUSTOMER'S PAYMENT INFORMATION VERIFICATION IS NOT SUCCESSFUL THEN:
(A) CUSTOMER IS GIVEN THE OPPORTUNITY TO CORRECT HIS SUBMITTAL AND TRY AGAIN;
(B) CUSTOMER CAN RETURN TO THE BEGINNING AND REPEAT THE ENTIRE PROCESS.

12. A CONFIRMATION OF THE TRANSACTION, CONTAINING THE TRANSACTION IDENTIFICATION AND OTHER PERTINENT INFORMATION IS RETURNED TO THE CUSTOMER.

1. Field of the Invention

In accordance with the present invention a remote location ticketing and reservation system for any venue comprises an internet or network compatible computer program constructed generally to afford access to a database, or other record maintained in electronic form, containing information about all sold and unsold seating for any specific venue or event and means and method by which a user, through use of a computer terminal or other such device, may access said database or other record and receive at his location through any computer terminal or other such device information about which specific seats remain available and then through a computer mouse or keyboard or other such input device select a specific seat or seats for that specific event and reserve such for himself for use during said event.

2. Prior Art

The inadequacies and inefficiencies of present ticketing and reservation systems are recognized and addressed through this invention. The rapid growth of the internet now makes it possible for anyone at his home or office to avail himself of the advantages of the instant invention through a simple internet or other wide area network connection.

Prior art makes a feeble attempt to address the inconvenience of ticket ordering. U.S. Pat. No. 5,797,126 (1988), Helbling, et al., describes a series of individual kiosks in wireless communication with a central station where a visitor can locate events of interest, view an excerpt of scenes from that venue and purchase tickets. This falls far short of the instant invention since it still requires a user to physically visit a remote site to avail himself of the service. Additionally, said prior art makes excessive use of what is called "kiosks" implying that, unlike the instant invention, it is only from his specialized machines that such services may be rendered.

U.S. Pat. No. 4,974,252 describes a more interactive theater attendance system where patrons are permitted two way communications between themselves and a broadcast center but this is still far from objectives of the instant invention and requires that persons be in attendance at the theater and, further some attendant be present at the remote broadcast center. The instant invention is fully automated and, other than the normal monitoring of any application for a wide area network, requires no human attendance or intervention.

U.S. Pat. No. 3,427,438 describes a ticket vending system where sales of tickets can be recorded on a seating layout but, again falls far short of the instantaneous update and automatic operation of the instant invention. U.S. Pat. No. 5,333,257 allows for a view from a seat but that is now common for internet applications where a hyperlink to any graphic is routinely provided and ancillary to and even unnecessary to the instant invention. Other prior art does nothing to make ticket ordering or seating reservations more readily available and does nothing to improve the information flow to prospective customers so that they may make a more informed decision about attending any given event.

Consider the traveler who has planned a vacation in, say, New York City and wants tickets for some Broadway show. Presently he has either to phone and accept someone else's definition of what constitutes "best available" or wait until he gets into town and seek out a scalper or reseller agency and he still isn't sure exactly what his seats offer.

3. Objects and Advantages

Several objects and advantages of the present invention are:

(a) to always provide customers with a seat selection comprised of the total of the then best available seats for any given event;
(b) to make equally available to all customers all then available seats for any given event to that said customer, so he may select for himself the seat or seats he wants for that event;
(c) to provide an alternative means to visiting box office or a ticket reseller for a customer to select and reserve for himself the then best available seat or seats for any arena, stadium, theater, airline flight or any other such venue where seating is available;
(d) to provide to a ticket sensitive venue operator better control over the seating and seat availability for the various events he offers;
(e) to provide to a ticket sensitive venue operator better accounting of his seating for the various events he offers;
(f) to provide to the general public a more cost effective means by which he may reserve and buy tickets for any given event;
(g) to provide to a venue operator a more cost effective means by which he may sell tickets for any given event;
(h) to provide to the general public an automated 24 hours a day, seven days a week means by which he may reserve and purchase the specific seats he wants for an event;
(i) to provide to a venue operator an automated 24 hours a day, seven days a week means by which he may offer reservation and purchase of a seat or seats that are individually selectable by a customer;
(j) to permit the venue operator to avoid overbooking an event;
(k) to permit the venue operator to avoid underbooking an event;
(l) to permit a doctor or other professional for whom his time is a commodity to better schedule and regulate his time and interact with patients or others in the online environment;
(m) to provide to the general public a 24 hours a day, seven days a week means by which they may schedule appointments with doctors, dentists, automotive mechanics and the like with full knowledge that the appointment time they select is still available.

Further objects and advantages are to provide any venue operator the benefit of better control over his ticket inventory and sales such as to improve his profitability and the efficiency of his operation and to provide to the general ticket buyer public better information and an easier means by which they may acquire their desired ticket or tickets for any event.

SUMMARY

The ticketing and reservation system of the present invention, in one particular embodiment thereof, includes a computer program operating on a server for a wide area network (WAN), generally described by the flow chart of FIG. 1 and the accompanying code example which implements the instant invention in practice:

First, when a user accesses the system means is provided to initialize the process and return to the user a menu from which he selects his venue of interest. This can be a selectable menu arranged by artist or date or time or specific theater or football team or baseball team or name or activity or any combination thereof such that the user is given sufficient information from which to make a decision. An example would be someone looking for the next event at a given theater at a time that starts at 7:00 pm. One of many possible series of computer instructions to perform this function is:

- Send database query to retrieve all venues that are currently available in the system
- Server receives and processes query
- Query is looped until all available performances and venues are retrieved
- Markup Language engine converts result to display compatible format for output to client computer
- Begin normal markup language here
- Begin reservation process selecting the event date/time next to the desired venue

THEN, upon user submission, the server initializes the process of returning to the user all available seats:

- Send database query to retrieve all seats that are currently available in the system for this event
- Server receives and processes query
- Query is looped until all available seats are retrieved
- Markup language engine converts result to markup language format for output to client computer
- Begin normal markup language here
- Continue reservation process by selecting the desired seat or seats

THEN, upon user submittal we create a new customer record in the Wide Area Network server and tell the system which database to connect to to fulfill the user's request(s):

- Send database command to insert new record for each selected seat in the reservation "detail" database
- Begin normal markup language here
- Continue reservation process by requesting client payment information

THEN, upon user submission the information is passed for verification:

- Submit client information for verification
- If verification is successful, send database command to update customer record in customer database with information previously collected
- If verification is successful, send database command to update reservation record in reservation "order" database with verification information
- If verification is successful, send database command to remove selected seats from seat inventory database and mark as no longer available for future selection
- Markup language engine converts result to markup language format for output to client computer
- Begin normal markup language here
- If verification is successful, confirmation is generated via Markup language engine to markup language format for output to client computer
- If verification is unsuccessful, a failure notice is generated via Markup language engine to markup language format for output to client computer
- If verification is unsuccessful, client is presented with option to provide his payment information again or abandon his reservation

While this is one preferred form of the code there are many other code sequences that will perform the same function that will be immediately obvious to one skilled in the art.

BRIEF DESCRIPTION OF THE DRAWINGS

The aforementioned objects and advantages of the present invention as well as additional objects and advantages thereof will be more fully understood hereinafter as a result of a detailed description of a preferred embodiment when taken in conjunction with the following drawings in which:

FIG. 1 is a block diagram of the present invention illustrating the major components thereof and the interactivity that takes place between the potential customer and the instant invention.

FIG. 2 is an illustration of the concept of the present invention utilizing the internet as the Wide Area Network to which users connect to perform the desired function and shows an example of a remotely located user accessing the functionality of the instant invention for purposes of reserving seats for a dinner theater performance in a distant city.

FIGS. 3A and 3B are illustrations of the concept of the present invention refined down to the functionality of reserving specific seats and blocking duplicate sale of those seats that are already reserved.

FIGS. 4A to 4E are sample screens seen by a remote user of the instant invention during a session wherein he selects and orders specific seats for a distant dinner theater show.

FIG. 5 is a complete code set for one preferred embodiment of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring to FIG. 1, it will be seen that the operator of a venue implements the instant invention for purposes of allowing remotely located users to reserve specific seating for specific events. By doing so, he initiates those certain
actions necessary to display an internet web site to all online users. A prospective customer for the venues offering(s) logs onto the internet and acquires the aforesaid internet web site which implements the instant invention. He can be connected to the internet by any conventional means yet this by no means implies that the widespread network must be what is commonly referred to as the “internet.” Upon first contact by the prospective customer, an inquiry is directed to the appropriate database, which may be located concurrently with the primary server hosting the program for the instant invention or may be located remotely, such as at the physical location of the venue, asking for a return of information to the prospective customer of all appropriate information contained therein relative to his inquiry. The prospective customer indicates his desired seat or seats through conventional computer input means and directs that information back to the server hosting the code necessary to the implementation of the instant invention. Upon contact the server again makes an appropriate database query and returns to the prospective customer all pertinent information relating to his selection, such as which seats are still available for the chosen performance, airline flight, boxing match, etc. The prospective customer is then presented with a representation of all then available seating for his selected venue. From this representation, the prospective customer makes his selection of a seat or seats by indicating such through a mouse click, keyboard entry or other means, such as but not limited to a touch screen. Simultaneously, the server, through the coding necessary to implement the instant invention, creates a temporary customer identification that is used to associate this potential customer with this later selection and permit system use by multiple simultaneous users. Once the customer has made his seat selection he is asked for payment information. That information is processed through conventional internet or other electronic means and once the information and payment are verified, the customer information, as supplied in the transaction, is made permanent and the seat or seats he has selected are removed from inventory and blocked from duplicate sale, both graphically when presented to the next prospective customer and in the database where information for accounting and administrative purposes is retained. If the customer’s payment information cannot be verified then he is given an opportunity to correct the information or start over with a new transaction. Upon verification of the customer’s payment information he receives a confirmation of the transaction containing all appropriate reference information for his records.

Referring to FIG. 2, it will be seen that, for example, a user in Houston is planning to vacation in New York and wishes to see a play at a dinner theater there that utilizes the present invention for ticketing and reservations. The user in Houston, or in any other location worldwide, connects to the internet in the conventional way and retrieves the appropriate web site through his graphical browser from a server located in, say, Anaheim, Calif. Through implementation of the instant invention the user is able to see the exact seating arrangement of the remote dinner theater and select the exact seat or seats he wants for the performance of his choice. Such additional information as is appropriate can be provided to the remote user to assist him in making an informed decision as to which seat or seats he wishes to occupy for this performance.

Referring to FIGS. 3A and 3B, it will be seen that in FIG. 3A that, at the user selected venue, all seats at table P11 17 and at table S14 21 have been previously taken and are so indicated by the graphical representation of an “X” over those seats. Our potential customer wishes to seat a party of four at table S16 and so indicates by clicking his mouse on those four seats or by so indicating through an alternative standard computer input means. Once his payment method is verified his selected seats are removed from inventory and so indicated on the graphical representation by placing an “X” over those seats while retaining the “X” over those seats previously sold at table P11 20 and table S14 21. The next prospective customer is advised that these seats are no longer available for this performance by the new graphical representation shown in FIG. 3B that is his first viewing screen upon entry into the system. In the event that two prospective customers wish to reserve the exact same seat or seats, that prospective customer who first receives validation of his payment method is given those seats while the other prospective customer is notified that while making his decision the seats he wants have already been sold and offers him a chance to select other seating.

Referring to FIGS. 4A to 4E, one will see the screens presented to a user when he accesses the system and as he progresses through the process of selecting a specific seat or seats, then reserves and pays for them. FIG. 4A is where the first screen presented shows links to available performances for that selected venue. FIG. 4B is the second screen and shows a view of the seating available for that venue with seats that have already been taken crossed off with an “X.” Our hypothetical user decides that he would like to have his party of four sit at table S1 25 and selects the four seats around that table by clicking on them with his mouse. As he moves his mouse over individual seats the seat number appears in the window at the bottom of his screen and when he clicks on a seat it is added to a running tally of the seats he has already taken. Only seats that have not previously been taken show up in the mouse-over window. After completing his selections the user clicks on the “Reserve Seats” button and FIG. 4C shows his next screen, which asks him for his payment information. He enters the required information and again clicks the “Reserve Seats” button. FIG. 4D is the next screen and it tells him that his payment method has been accepted (or rejected) and relations information about the transaction such as his transaction code and the receipt number that he can use as a ticket or as a voucher with which to redeem his ticket or tickets at the venue box office when he arrives for the performance. Finally, FIG. 4E shows the opening screen the next visitor to the system is presented with the same set of screens except that the seats reserved by our hypothetical user are marked off as already taken.

Referring to FIG. 5, one will see one of many possible coding schemes making possible the results of the present invention.

Those having skill in the art to which the present invention pertains will now understand that there are virtually unlimited uses for the present invention. By way of example, the present invention may be readily used to reserve specific seats on commercial airliners or reserve specific staterooms on a cruise ship, as well as for reserving seats for any venue from community theater or little league baseball to major league sporting events.

The present invention has been described in sufficient detail to enable one skilled in the art to make and use the invention. Accordingly, specific details which are readily available in the art or otherwise conventional have been omitted to prevent obfuscation of the essential features of the invention.

In view of the foregoing it will be understood that the present invention may be implemented in a variety of alternative methods but that all such implementations are deemed to be within the scope of the present invention which is to be limited only by the claims appended hereto.
What is claimed is:

1. A computer-implemented method for reserving seats, the method comprising:
   transmitting first data to an application running on a general purpose computer associated with a first user and a general purpose computer associated with a second user, the first data including information descriptive of available individual seats on one or more flights, the first data encoded to cause the application to generate graphical user interfaces on the general purpose computers associated with the first and second users that comprise interactive seating maps representing individual seats on the one or more flights;
   receiving from the general purpose computer associated with the first user second data representing a seat selected by the first user;
   receiving from the general purpose computer associated with the second user third data representing a seat selected by the second user, wherein the seat selected by the second user is the same as the seat selected by the first user;
   receiving from the general purpose computer associated with the first user fourth data representing payment information;
   requesting verification of the received payment information; and
   if the received payment information is verified, then transmitting fifth data to the general purpose computer associated with the second user, the fifth data including information indicating that the seat selected by the second user is no longer available.

2. The computer-implemented method of claim 1, wherein the fifth data is transmitted in response to a request from the second user.

3. The computer-implemented method of claim 1 further comprising locking a record in a database indicating the seat selected by the first user, if the received payment information is verified.

4. A system for reserving seats, the system comprising:
   a data storage system storing a plurality of entries denoting a plurality of available individual seats on one or more flights; and
   a server programmed via executable instructions to:
   query the data storage system for information descriptive of the available individual seats on the one or more flights;
   transmit first data to an application running on a general purpose computer associated with a first user and a general purpose computer associated with a second user, the first data including information descriptive of the available individual seats on the one or more flights, the first data encoded to cause the application to generate graphical user interfaces on the general purpose computers associated with the first and second users that comprise interactive seating maps representing individual seats on the one or more flights;
   receive, from the general purpose computer associated with the first user, second data representing a seat selected by the first user;
   receive, from the general purpose computer associated with the second user, third data representing a seat selected by the second user, wherein the seat selected by the second user is the same as the seat selected by the first user;
   receive from the general purpose computer associated with the first user fourth data representing payment information;
   request acceptance of the received payment information; and
   if the received payment information is accepted, then transmit fifth data to the general purpose computer associated with the second user, the fifth data including information indicating that the seat selected by the second user is no longer available.

5. The system of claim 4, wherein the server is further programmed to transmit the fifth data in response to a request from the second user.

6. The system of claim 4, wherein the server is further programmed to lock a record in a database indicating the seat selected by the first user, if the received payment information is accepted.

7. A computer-readable medium comprising instructions configured to cause a computer system to perform operations comprising:
   transmitting first data to an application running on a general purpose computer associated with a first user, the first data including information descriptive of available individual seats on one or more flights, the first data processed by the application to generate a graphical user interface on the general purpose computer that comprises an interactive seating map representing individual seats on the one or more flights;
   receiving, from the general purpose computer, a selection of one or more seats; and
   transmitting second data to the general purpose computer, based at least in part on a determination that the one or more selected seats were previously selected by a second user, and further based on a determination that payment information from the second user for the one or more selected seats was verified, wherein the second data includes information indicating that the one or more selected seats are no longer available.

8. The computer-readable medium of claim 7, wherein the second data is transmitted in response to receiving a request from the general purpose computer.
It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

In column 2 (page 3 item 56) at line 72, Under Other Publications, change “Implentations” to -Implementations-.

In column 1 (page 4 item 56) at line 5, Under Other Publications, change “creat” to --create--.

In column 1 (page 4 item 56) at line 48, Under Other Publications, change “Uneforceability,” to --Unenforceability,--.

In column 1 (page 4 item 56) at line 53, Under Other Publications, change “Uneforceability,” to --Unenforceability,--.

In column 1 (page 4 item 56) at line 63-64, Under Other Publications, change “(Mindscapre Incs wargame),” to --(Mindscape Inc wargame),--.

In column 2 (page 4 item 56) at line 67, Under Other Publications, change “Indstry” to --industry--.

In column 1 (page 5 item 56) at line 16, Under Other Publications, change “Accessiblity” to --Accessibility--.

In column 1 (page 5 item 56) at line 24, Under Other Publications, change “Termial” to --Terminal--.

In column 1 (page 5 item 56) at line 53, Under Other Publications, change “DEFPA014969-996).” to --(DEFPA014969-996).--.

In column 1 (page 7 item 56) at line 23, Under Other Publications, after “Sentinel,” delete “The Stentinel”.

In column 1 (page 7 item 56) at line 27, Under Other Publications, change “html,” to --html.--.

In column 2 (page 7 item 56) at line 7, Under Other Publications, change “world wide” to --worldwide--.

Signed and Sealed this Twenty-sixth Day of March, 2013

Teresa Stanek Rea
Acting Director of the United States Patent and Trademark Office
CERTIFICATE OF CORRECTION (continued)
U.S. Pat. No. 8,229,774 B2

In column 2 (page 7 item 56) at line 61, Under Other Publications, change “Quatar” to --Qatar--.

In column 1 (page 8 item 56) at line 36, Under Other Publications, change “Introduction,” to -Introduction.--.

In column 1 (page 8 item 56) at line 37, Under Other Publications, change “of2)” to --of 2)--.

In column 1 (page 8 item 56) at line 39, Under Other Publications, change “Introduction,” to -Introduction.--.

In column 1 (page 10 item 56) at line 55, Under Other Publications, change “Sweepstakes” to --Sweepstakes--.

In column 1 (page 11 item 56) at line 37, Under Other Publications, change “o” to --to--.

In column 1 (page 11 item 56) at line 42, Under Other Publications, change “Siteas” to --Site as--.

In column 2 (page 11 item 56) at line 18, Under Other Publications, change “Dx” to --DX--.

Sheet 12 of 30 (FIG. 5 CONT.) at line 7, Change “<TABLE>” to --</TABLE>--.

Sheet 13 of 30 (FIG. 5 CONT.) at line 2, Change “a input” to --an input--.

Sheet 13 of 30 (FIG. 5 CONT.) at line 16, Change “+idnum+”, to --+idnum+”,--.

Sheet 14 of 30 (FIG. 5 CONT.) at line 4, Change “old,” to --oid,--.

Sheet 15 of 30 (FIG. 5 CONT.) at line 22, Change “corrds,” to --coords,--.

Sheet 18 of 30 (FIG. 5 CONT.) at line 13, Change “reserve1.ihtml” to --“reserve1.ihtml”--.

Sheet 19 of 30 (FIG. 5 CONT.) at line 14, Change “ihtmr>” to --.ihtml>-.--.

Sheet 19 of 30 (FIG. 5 CONT.) at line 15, Change “reserve1.ihtml” to --“reserve1.ihtml”.--.

Sheet 19 of 30 (FIG. 5 CONT.) at line 28, Change “combines” to --combines--.

Sheet 22 of 30 (FIG. 5 CONT.) at line 22, Change “ip and” to --id is--.

Sheet 22 of 30 (FIG. 5 CONT.) at line 23, Change “attrieval” to --retrieval--.

Sheet 22 of 30 (FIG. 5 CONT.) at line 26, Change “(ip,” to --(id,--.

Sheet 22 of 30 (FIG. 5 CONT.) at line 27, Change “(‘:i_ip’,1)” to --‘:i_id’,1)--.

Sheet 23 of 30 (FIG. 5 CONT.) at line 13, Change “’resere3.ihtml’,” to --“resere3.ihtml’”,--.

Sheet 23 of 39 (FIG. 5 CONT.) at line 21, Change “’resere3.ihtml’” to --“resere3.ihtml’”--.

Sheet 27 of 30 (FIG. 5 CONT.) at line 19, Change “:ipay_” to --:i_pay_--.

In column 5 at line 67, Change “s1” to --S1--.

In column 6 at line 26, Change “s1” to --S1--.

In column 6 at line 67, Change “hereto:” to --hereto.--.
