

US009172987B2

(12) **United States Patent**  
**Lemmons et al.**

(10) **Patent No.:** **US 9,172,987 B2**  
(45) **Date of Patent:** **\*Oct. 27, 2015**

(54) **METHODS AND SYSTEMS FOR UPDATING  
FUNCTIONALITY OF A SET-TOP BOX USING  
MARKUP LANGUAGE**

(75) Inventors: **Thomas R. Lemmons**, Sand Springs,  
OK (US); **Jon C. Zaring**, Tulsa, OK  
(US)

(73) Assignee: **Rovi Guides, Inc.**, Santa Clara, CA (US)

(\*) Notice: Subject to any disclaimer, the term of this  
patent is extended or adjusted under 35  
U.S.C. 154(b) by 0 days.

This patent is subject to a terminal dis-  
claimer.

(21) Appl. No.: **13/193,233**

(22) Filed: **Jul. 28, 2011**

(65) **Prior Publication Data**

(57) **ABSTRACT**

An interactive television program guide is provided. Program  
guide display elements are arranged and styled using markup  
language documents. These markup language documents  
may also indicate and select program guide functions. The  
program guide interprets the markup language documents  
and generates the display screens and program guide func-  
tionality without user intervention. The program guide may  
also be updated by supplying new markup language docu-  
ments that modify display screens and program guide func-  
tionality. The markup language documents may be supplied  
by a main facility or a television distribution facility.

# METHODS AND SYSTEMS FOR UPDATING FUNCTIONALITY OF A SET-TOP BOX USING MARKUP LANGUAGE

## CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. patent application Ser. No. 11/432,686, filed May 10, 2006 (now U.S. Pat. No. 8,010,979), which is a continuation of U.S. patent application Ser. No. 10/171,424, filed Jun. 12, 2002 (now U.S. Pat. No. 7,073,188), which is a continuation of U.S. patent application Ser. No. 09/227,358, filed Jan. 8, 1999 (now U.S. Pat. No. 6,442,755), which claims the benefit of U.S. provisional patent application No. 60/091,975, filed Jul. 7, 1998. These prior applications are hereby incorporated by reference herewith in their entireties.

## BACKGROUND OF THE INVENTION

This invention relates to video systems, and more particularly, to interactive television program guide systems which provide for the flexible modification of program guide user screen layouts and program guide functionality.

Cable, satellite, and broadcast television systems provide viewers with a large number of television channels. Users have traditionally consulted printed television program schedules to determine the programs being broadcast at a particular time. More recently, interactive electronic television program guides have been developed that allow television program information to be displayed on a user's television.

Interactive program guides allow the user to navigate through television program listings using a remote control. In a typical program guide display, television listings are organized and displayed in subsets according to multiple selection criteria and are sorted in various ways. For example, one approach is to organize program listings into a grid.

With current interactive program guides, user screens (e.g., screens containing program listings) and program guide functionality are fixed. It is generally not possible to change user screens or program guide functionality without downloading an entire new program guide application.

Accordingly, it would be desirable if a markup language could be used to provide for the downloading display characteristics of user screens and program guide functionality as plug-ins anytime, without modifying the code of the application.

It is therefore an object of the present invention to provide an interactive television program guide that arranges program guide display elements using a markup language.

It is also an object of the present invention to provide an interactive television program guide that indicates and selects program guide functionality using a markup language.

It is also an object of the present invention to provide an interactive television program guide that may be updated by downloading markup language documents without user intervention.

## SUMMARY OF THE INVENTION

This and other objects of the invention are accomplished in accordance with the principles of the present invention by providing an interactive program guide system that has program guide display screen look and functionality assigned updated using markup language documents.

2

Program guide data is provided by a data source in a satellite uplink facility. This information is transmitted to a television distribution facility such as a cable headend via a satellite link. The television distribution facility distributes the information (and television programming signals) to user television equipment on which an interactive television program guide is implemented. One suitable distribution scheme involves transmitting television channels and distributing the information for program listings in the vertical blanking interval of one of the channels or in a sideband. Alternatively, the information for program listings may be provided on a television channel sideband, using an in-band digital channel, using an out-of-band digital signal, or by any other suitable data transmission technique.

The user television equipment for receiving and processing the television program listings and program listings information may include a set-top box. The set-top box is also able to receive the television programming distributed by the television distribution facility. The program guide implemented on the set-top box processes television program listings information and generates display screens (e.g., an interactive television, program guide grid) for display, e.g., on a standard television monitor.

Program guide display elements may have a set of associated attributes. Display element attributes may include display element style and layout information (e.g., font size, font type, color, screen coordinates, etc.), actions as with the display element, or any other suitable attribute. Display item actions may be indicated and selected using the markup language documents. The markup language used may be any suitable markup language or system of marking up, or tagging, a document (e.g., text file) so that the document indicates user display screen layout and styling and program guide functionality. For example, the markup language document may contain HyperText Markup Language (HTML), Dynamic HyperText Markup language (DHTML), or Extensible Markup Language (XML) code. The program guide is programmed to interpret the markup language documents and generate the display screens and provide program guide functionality according to the documents.

The use of a markup language provides an interactive television program guide in which display screens may be modified by downloading markup language documents without user intervention and without modifying the code of the application. Application functionality may be modified by attaching documents to the different modules in the same manner. The use of a markup language also allows a control entity to control some of the appearance and functionality of the guide and to create enhanced features and promotions based on designing a screen layout with off-the-shelf markup language editors and/or viewers.

Further features of the invention, its nature and various advantages will be more apparent from the accompanying drawings and the following detailed description of the preferred embodiments.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic block diagram of a system in accordance with the principles of the present invention.

FIG. 2 is a schematic block diagram of illustrative user television equipment in accordance with the principles of the present invention.

FIG. 3 is a generalized schematic block diagram of portions of the illustrative television equipment of FIG. 2.

FIG. 4 is an illustrative program listings grid in accordance with the principles of the present invention.

FIG. 5 is an illustrative program listings list in accordance with the principles of the present invention.

FIGS. 6a and 6b are illustrative display screens in accordance with the principles of the present invention.

FIGS. 7a-7b illustrate how different markup language documents may be used to arrange and style display elements and indicate and select program guide functionality.

FIGS. 8-10 are flow charts of steps involved in the operation of the present invention.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

An illustrative system 10 in accordance with the present invention is shown in FIG. 1. Main facility 12 provides data from program guide data source 14 to television distribution facility 16 via communications link 18. There are preferably numerous television distribution facilities 16, although only one such facility is shown in FIG. 1 to avoid overcomplicating the drawing. Link 18 may be a satellite link, a telephone network link, a cable or fiber optic link, a microwave link, a combination such links, or any other suitable communications path. If it is desired to transmit video signals over link 18 in addition to data signals, a relatively high bandwidth link such as a satellite link may generally be preferred to a relatively low bandwidth link such as a telephone line. Television distribution facility 16 may be any appropriate distribution facility, such as a cable system headend, a broadcast distribution facility, or a satellite television distribution facility.

The program guide data transmitted by main facility 12 to television distribution facility 16 includes television program listings data (e.g., program times, channels, titles, and descriptions) and other program listings information for additional services other than television program listings (e.g., weather information, associated Internet web links, computer software, etc.). It may also contain markup language documents such as HyperText Markup Language (HTML), Dynamic HyperText Markup Language (DHTML), or Extensible Markup Language (XML) documents, for updating the display screen layouts and functionality of a program guide without user intervention.

The markup language documents may include the code of any suitable markup language or system of marking up, or tagging, a document (e.g., text file) so that the document arranges user display screen layout and styling and indicates program guide functionality. For example, the markup language document may contain DHTML, or XML code. The program guide is programmed to interpret the markup language documents and generate the display screens and provide program guide functionality according to the documents.

Television distribution facility 16 distributes the television program listings, additional data, and markup language documents to multiple users via communications paths 20. Each user has user television equipment 22 for displaying the television program listings information using an interactive television program guide. Communication paths 20 preferably have sufficient bandwidth to allow television distribution facility 16 to distribute television programming to user television equipment 22. If desired, television programming may be provided over separate communications paths (not shown).

Program guide data may be distributed to user television equipment 22 using any suitable scheme. For example, program guide data may be provided in a continuous stream or may be transmitted at a suitable time interval (e.g., once per hour). If transmitted continuously, it may not be necessary to

store the data locally at user television equipment 22. Rather, user television equipment 22 may extract data "on the fly" as it is needed. If desired, television distribution facility 16 may poll user equipment 22 periodically for certain information (e.g., pay program account information or information regarding programs that have been purchased and viewed using locally-generated authorization techniques).

For clarity the present invention will be illustrated in connection with a system arrangement in which program guide data is distributed from a main facility to an interactive television program guide implemented on user television equipment, via a television distribution facility. Other suitable systems involve systems in which data is distributed to a program guide on user television equipment using other suitable distribution schemes, such as schemes involving data transmission over the Internet or the like. If desired, the interactive television program guide application may be implemented using a client-server architecture in which the primary processing power for the application is provided by a server located at, for example, the television distribution facility or the main facility and user television equipment acts as a client processor.

An illustrative arrangement for user television equipment 22 is shown in FIG. 2. User television equipment 22 of FIG. 2 receives video and data from television distribution facility 16 (FIG. 1) at input 26. During normal television viewing, the user tunes set-top box 28 to a desired television channel. The signal for that television channel is then provided at video output 30. The outputted signal is typically either a radio-frequency (RF) signal on a predefined channel (e.g., channel 3 or 4), or a demodulated video signal, but may also be a digital signal provided to television 36 on an appropriate digital bus (e.g., a bus using the IEEE 1394 standard, (not shown)). The video signal at output 30 is received by optional secondary storage device 32.

Optional secondary storage device 32 can be any suitable type of analog or digital program storage device (e.g., a videocassette recorder, a digital video disc (DVD) player with the ability to record DVD discs, etc.). Program recording and other features may be controlled by set-top box 28 using control path 34. If secondary storage device 32 is a videocassette recorder, for example, a typical control path 34 involves the use of an infrared transmitter coupled to the infrared receiver in the videocassette recorder that normally accepts commands from a remote control such as remote control 40. Remote control 40 may be used to control set-top box 28, secondary storage device 32, and television 36.

The interactive television program guide may run on set-top box 28, on television 36 (if television 36 has suitable processing circuitry and memory), or on a suitable analog or digital receiver connected to television 36. The interactive television program guide may also run cooperatively on both television 36 and set-top box 28. Interactive television application systems in which a cooperative interactive television program guide application runs on multiple devices are described, for example, in Ellis U.S. patent application Ser. No. 09/186,598, filed Nov. 5, 1998 which is hereby incorporated by reference herein in its entirety.

The user may record programs and program data in digital form on optional digital storage device 31. Digital storage device 31 may be a writable optical storage device (such as a DVD player capable of handling recordable DVD discs), a magnetic storage device (such as a disk drive or digital tape), or any other digital storage device. Interactive television program guide systems that have digital storage devices are described, for example, in Hassell et al. U.S. patent applica-

5

tion Ser. No. 09/157,256, which is hereby incorporated by reference herein in its entirety.

Digital storage device **31** can be contained in set-top box **28** or it can be an external device connected to set-top box **28** via an output port and appropriate interface. If necessary, processing circuitry in set-top box **28** formats the received video, audio and data signals into a digital file format. Preferably, the file format is an open file format such as the Motion Pictures Expert Group (MPEG) MPEG-2 standard. The resulting data is streamed to digital storage device **31** via an appropriate bus (e.g., a bus using the IEEE 1394 standard), and is stored on digital storage device **31**.

Television **36** receives video signals from secondary storage device **32** via communications path **38**. The video signals on communications path **38** may either be generated by secondary storage device **32** when playing back a prerecorded storage medium (e.g., a videocassette or a recordable digital video disc), by digital storage device **31** when playing back a prerecorded digital medium, may be passed through from set-top box **28**, may be provided directly to television **36** from set-top box **28** if secondary storage device **32** is not included in user television equipment **22**, or may be received directly by television **36**. During normal television viewing, the video signals provided to television **36** correspond to the desired channel to which the user has tuned with set-top box **28**. The video signals provided to television **36** may also be by set-top box **28** when set-top box **28** is used to play back information stored on digital storage device **31**.

A more generalized embodiment of user television equipment **22** (FIG. 2) is shown in FIG. 3. As shown in FIG. 3, control circuitry **42** of user television equipment **22** receives the program guide data, programming, and markup language documents from television distribution facility **16** (FIG. 1). Video signals are typically provided on multiple television channels. The program guide data and markup language documents may be provided on a television channel sideband, in the vertical blanking interval of a television channel, using an in-band digital channel, using an out-of-band digital signal, or by any other suitable data transmission technique.

Control circuitry **42** may be configured to interpret the markup language documents and to generate program guide display screens for display on monitor **45**. The program guide display screens may be generated with display items at positions and with styles that are indicated by the markup language documents. In addition, actions assigned to display items by the markup language documents may be selected by control circuitry **42** to provide program guide functionality. The functions of control circuitry **42** may be provided using the set-top box arrangement of FIG. 2. Alternatively, these functions may be integrated into an advanced television receiver, personal computer television (PC/TV), or any other suitable arrangement. If desired, a combination of such arrangements may be used. In client-server based program guides, for example, control circuitry **42** may be contained in suitable equipment at television distribution facility **16**.

The user controls the operation of user television equipment **22** with user interface **46**. User interface **46** may be a pointing device, wireless remote control, keyboard, touchpad, voice recognition system, or any other suitable user input device. To watch television, the user instructs control circuitry **42** to display a desired television channel on monitor **45**. To access the features of the program guide, the user instructs the program guide implemented on user television equipment **22** to generate a main menu or a desired program guide display screen for display on monitor **45**.

When a user indicates a desire to view television programming information (e.g., by using a "guide" key on remote

6

control **40**), the program guide generates an appropriate program guide display screen, such as a program listings screen, for display on monitor **45**. A program listings screen may contain one or more lists of programs organized according to multiple organization criteria (e.g., by program type, theme, or any other pre-defined or user defined and selectable criteria) and sorted in various ways (e.g., alphabetically). The program listings screen may be overlaid over a program being viewed by the user or overlaid over a portion of the program in a "browse" mode.

One approach is to organize program listings into a program listings grid. FIG. 4 illustrates the display of program listings in program listings grid **150**. Program listings grid **150** may be divided into a number of columns **162** which correspond to program broadcast times and which may be equally spaced apart (e.g., in thirty-minute steps). Program listings may be displayed in the grid in sub-sets according to multiple selectable organization criteria and sorted in various ways. Program listings row **152** contains, for example, selectable program listings for THE DESERTS OF AFRICA and WILDLIFE on channel **46** (Public Television). Program listings row **154** contains, for example, selectable program listings for GHOST and TITANIC on channel **47** (HBO). Program listings row **156** contains, for example, selectable program listings for programs BLUES BROTHERS on shared channel **48** (VH-1). Program listing row **158** contains, selectable program listings for programs, PPV **1**, and PPV **2** on channel **49** (ADU). Program listings row **160** contains a selectable program listing for COOKING on channel **49** (WPTU). The programs on each channel are typically different.

Program listings grid **150** may have movable cell highlight region **151**, which highlights the current grid cell. The user may position highlight region **151** by entering appropriate commands with user interface device **52**. For example, if user input interface device **52** has a keypad, the user can position highlight region **151** using "up," "down," "left," and "right" cursor keys. Remote program listings may also be panned left, right, up, and down by positioning highlight region **151** using the cursor keys on remote control **70**. Alternatively, a touch sensitive screen, trackball, voice commands, or other suitable device may be used to move highlight region **151** or to select program listings without the use of highlight region **151**. In still another approach, the user may speak a television program listing into a voice request recognition system. Any other suitable approach may be used.

After a user selects a program listing, the interactive program guide may provide the user with the opportunity to access a number of program guide features. For example, the user may access additional information (typically text or graphics, but possibly video and other information) about the listing, set a reminder, schedule an associated program for recording, set parental control features, set and navigate through favorite channels, or any other suitable program guide feature.

Program listings may also be displayed for the user in a list. FIG. 5 illustrates a program listings display screen having a program listings list displayed in accordance with the principles of the present invention. Scrollable program listings lists may display program listings in subsets according to user-selected organization criteria. Any suitable organization criteria and sorting scheme may be used. Scrollable program listings list **170** of FIG. 8, for example, organizes program listings according to program type and then sorts the listings alphabetically in each sub-set. The television program listings display screen of FIG. 5 also has movable cell highlight region **171** for moving within the list and selecting listings.

Program guide display screens may display a number of display elements such as program listings grid **150**, program listings list **170**, or any other suitable display element. Display elements may be arranged or styled using the markup language documents. Program guide functions may be indicated and selected using the markup language documents. Preferably, the markup language used is a standardized and widely accepted markup language, such as HTML, DHTML, or XML. The program guide is also programmed to interpret the markup language documents. The program guide is programmed to generate display screens and select program guide functionality according to the markup language documents.

Display screen style and layout and program guide functionality may be set initially for the program guide and later modified by the markup language documents supplied by main facility **12** (FIG. 1) to the interactive television program guide. In practice, when the program guide is going to be updated with a new markup language document an operator at a main facility, television distribution facility, or other interested facility generates a desirable markup language document using any suitable word processor or markup language document editor. The markup language document may be provided to the interactive program guide manually or automatically (e.g., at a predefined time). The markup language document is provided to, stored by, and interpreted by the interactive program guide without the intervention of the user. This provides for allowing an operator to centrally update the display characteristic and functionality of the program guide without user intervention.

Display elements are defined using a non-markup language approach and are preprogrammed into the program guide. Display elements may, for example, be programmed into the interactive program guide using any suitable programming language (e.g. Visual BASIC, C++, etc.). The markup language documents may organize display element attributes (e.g., style, layout, and action attributes) into finite sets of display element attributes which may be a subset of the attributes actually programmed into the program guide. The sets of display element attributes may be assigned to the display elements using indicators, or tags. The tags may indicate where to place the defined display elements on the program guide display screen. The tags may also indicate styles to be applied to the display elements. Preferably, the display elements are programmed to render themselves to the program guide display screen at the position and with the style defined in the markup language document. The defined display elements may include any suitable program guide display screen element, such as advertisement elements, program listings grid elements, video window elements, text window elements, or any other suitable display screen or standard markup language element.

Program guide functions are defined using a non-markup language approach and are preprogrammed into the program guide. Functions may, for example, be programmed into the program guide using any suitable programming language (e.g. Visual BASIC, C++, etc.). Program guide functionality may be apparent to the user through display element actions, or may be transparent. Any suitable display element action may be assigned and selected using markup language documents. For example, one action may be to replace a partial screen program listings grid (e.g., grid **150**) with a full-screen program listings grid in response to a suitable user command. Another action may cause the grid to scroll, page, change its display (e.g., display listings by theme instead of channel, display listings in a list instead of in a grid), start a program search or action list, or perform any other suitable action in

response to a suitable user command. The user selection of a program listing in the grid may, for example, cause the program guide to display a program listings information screen, start a recording, set a reminder, or perform other suitable actions.

When markup language documents are supplied to the interactive television program guide, the program guide interprets the documents and generates or modifies the appropriate program guide display screens and program guide functionality according to the documents without intervention by the user. The display characteristics of the display screens may be changed without the need for updating application code, and may be completed in real time and without ever involving the user in the update process.

FIG. **6a** illustrates how a display screen, screen **50**, may look after the program guide has been programmed with a markup language document, has interpreted it, and has generated the display screen and selected program guide functionality. Screen **50** may contain a number of display elements. For example, screen **50** may contain video window **52** and text window **54** for displaying promotional videos and information regarding the program being promoted (e.g., subscription price), respectively. Screen **50** may also have graphic window **57** for displaying a program listings grid (FIG. **4**), such as program listings grid **150**, or a program listings list, such as program listings list **170** (FIG. **5**), or other graphic.

Screen **50** may also contain other display elements, such as on-screen options, or "buttons", which allow the user to access some feature of the program guide. For example, the user may "press" subscribe button **56** by entering appropriate commands on user interface **46** (FIG. **3**). By pressing subscribe button **56** the program guide may allow the user to subscribe to the program being promoted. Screen **50** may also include a picture of the local service provider's logo, such as logo area **58**.

The layout of screen **50** may become undesirable over time. For example, it may be decided that having a bigger video area and a smaller text area would be more attractive to the user. It may also be desirable to add additional features to the display screen, such as providing a "next" and "previous" button to allow users to scroll through promotional videos at their own pace. It may also be desirable to update the logo of the service provider.

FIG. **6b** illustrates how the display screen characteristics of screen **50** may be changed after the program guide has been supplied with a new markup language document from main facility **12** or television distribution facility **16** (FIG. **1**) and has interpreted the document and regenerated screen **50**. After screen **50** is regenerated by the program guide, video window **52**, text window **54**, and graphic window **57** may have been resized and repositioned accordingly. In addition if graphic window **57** contains a program listings grid, for example, the number of rows or columns of the grid may be changed, the start time of the grid adjusted, or any other suitable change to the grid made. Logo area **58** may have been resized and repositioned. Logo area **58** may also have been reformatted or styled by, for example, changing the style of text used, changing the colors of the logo, or by adding any other type of special effect. Next button **60** and previous button **62** may have been added.

FIG. **7a** illustrates how markup language documents may be used initially to arrange and style display elements and to indicate and select program guide functionality using a markup language document that is initially supplied to the program guide. Any suitable markup language or approach may be used. In practice, the markup language documents

may be continuous, from top to bottom and the attributes of display items may immediately follow below a display item tag. Markup language document **300** has been illustrated, however, having left and right portions **302** and **304** to more clearly illustrate the principles of the present invention. Portion **302** of markup language document **300** illustrates how display element identifier **300** may be tagged by tags **306**. Portion **304** of markup language Document **300** illustrates how display element attributes may be organized into sets using markup language documents and assigned using the tags.

As shown in FIG. 7a, display element attributes **310** and **312** may be organized into sets **313**, **315**, and **317**. Each display element may be assigned a set of attributes. Markup language document **300** may tag display element identifiers **330** using tags **306**. Tags **306** are generically labeled T1, T2, and T3 to indicate which display element is being tagged (display element 1, display element 2, and display element 3, respectively). Tags **306** have associated attributes **310** (e.g., A1, A2, A4, A5, A7, and A8) from the sets that may indicate, for example, where on the display screen the display elements will be placed, their size, and how they will be styled (e.g., color, font special effects, etc.). To generate a display screen such as screen **308**, the interactive program guide may parse the markup language document, extract the style and layout information, and generate a display screen accordingly.

FIG. 7a also illustrates how program guide functionality may be indicated and selected using markup language document **300**. The program guide may have been preprogrammed with a large number of actions. Portion **304** of markup language document **300** may be used to select from those actions the actions that are suitable for a particular display element. Attributes **312** may be included in the finite sets of attributes **313**, **315**, and **317** to indicate the selected actions. While a display item may have multiple associated actions (e.g., a menu), only one attribute **312** has been shown for each set to avoid overcomplicating the drawing. The actions may be assigned to display elements **314** as indicated in FIG. 7a using tags **306**.

FIG. 7b illustrates how the display characteristics of display screen **308** may be changed or modified by rearranging and restyling display elements **314** using a different markup language document, such as markup language document **340**. As shown, markup language document **340** may use tags **306** to assign sets of attributes to the display items. When the interactive program guide interprets and parses markup language document **340**, it obtains the new or changed attributes **310'** from the sets and uses tags **306** to generate, for example, display screen **308'** with display elements **314'**. As illustrated when display screen **308'** is compared with display screen **308** of FIG. 7a, display elements **314** may be resized, repositioned, and restyled (not shown). Thus, a first markup language document (**300**) may be used by the interactive program guide to generate a first display screen **308**, and a second markup language document (**340**) may be used to modify the display screen (**308'**) (e.g., reposition, resize, and restyle display elements **314**), thereby generating a second display screen with display characteristics different from the first.

FIG. 7b also illustrates how different actions for the display elements may be assigned and selected using markup language documents. Different actions may be included in the sets as illustrated when comparing sets **313**, **315**, and **317** of FIG. 7a with sets **313'**, **315'**, and **317'** of FIG. 7c. New actions may be indicated and previously indicated actions dropped, as illustrated by set **317'** and **315'**, (e.g., A12 and A6). In addition, the actions may be selected for different display

elements as shown in set **313'** (e.g., A7 was moved from set **317** of FIG. 7a to set **313'** of FIG. 7b).

Steps involved in operating the program guide of the present invention are set forth in FIGS. 8-10. FIG. 8 illustrates steps involved in generating display screens. At step **400**, the program guide is supplied with markup language documents which arrange and style the display elements as part of the initial programming of the program guide. The documents are preferably of a widely accepted and standardized markup language, such as HTML, DHTML, XML, or any other suitable markup language. At step **410**, the program guide interprets the markup language documents. Particular types of markup language documents may be interpreted at substeps **412**, **414** and **415**, respectively. The display screens are generated according to the markup language documents at step **420**. This may include substeps **422**, **424**, and **426**, in which the display elements are arranged, sized, and styled, respectively. At step **440**, the program guide displays the display screens according to the markup language documents.

FIG. 9 illustrates steps involved in modifying program guide display screens. At step **450**, the program guide is supplied with markup language documents which may resize, reposition, or restyle the display elements. The documents are preferably of a widely accepted and standardized markup language, such as HTML, DHTML, XML, or any other suitable markup language. At step **460**, the program guide interprets the markup language documents. Particular types of markup language documents may be interpreted at substeps **462**, **464**, and **466** respectively. The display screens are modified at step **470**. This may include substeps **472**, **474**, and **476**, in which the display elements are resized, repositioned, and restyled respectively. At step **480**, the program guide displays the display screens according to the markup language documents.

FIG. 10 illustrates steps involved in assigning and selecting program guide functionality. The program guide functionality indicated, and selected may be apparent or hidden to the user. At step **500**, the program guide is supplied with markup language documents which assign program guide functionality to display items. The documents may be supplied as part of the initial programming of the program guide, or may be supplied by a main facility or television distribution facility when the program guide is updated. The documents are preferably of a widely accepted and standardized markup language, such as HTML, DHTML, or XML. At step **510**, the program guide interprets the markup language documents. As shown, HTML, DHTML, or XML markup language documents may be interpreted at substeps **512**, **514**, and **516**, respectively. Program guide functionality is selected for the display items at step **520** according to the markup language documents. At step **540**, the program guide performs the selected functions.

The foregoing is merely illustrative of the principles of this invention and various modifications can be made by those skilled in the art without departing from the scope and spirit of the invention.

What is claimed is:

1. A method comprising:

generating for display, with a set-top box, a display item having a first program function, wherein the first program function is based on a non-markup language, and the first program function is preprogrammed on the set-top box;

receiving, with the set-top box, a markup language document, from a remote source;

## 11

interpreting the markup language document, with the set-top box, to determine that the markup language document assigns a second program function to the display item;

updating the set-top box based on the markup language document such that the display item has the second program function; and

generating for display, with the set-top box, the display item having the second program function.

2. The method of claim 1, wherein the updating the set-top box is in response to a user input.

3. The method of claim 1, wherein the second program function causes a display of the display item to change in response to a user input.

4. The method of claim 1, wherein updating the set-top box based on the markup language document such that the display item has the second program function comprises updating a displayed plurality of program listings from being displayed on a first portion of the display screen having a first size to the plurality of program listings being displayed on a second portion of the screen having a second size, where the second size is larger than the first size.

5. The method of claim 1, wherein updating the set-top box based on the markup language document such that the display item has the second program function comprises updating a displayed plurality of program listings from being displayed in an arrangement by channel to the plurality of program listings being displayed in an arrangement by theme.

6. The method of claim 1, wherein updating the set-top box based on the markup language document such that the display item has the second program function comprises updating a displayed plurality of program listings from being displayed as a grid to the plurality of program listings being displayed as a list.

7. The method of claim 1, wherein the second program function causes, in response to a user input, the updated set-top box to generate for display a program listing information screen, start a recording, set a favorite channel, or set a reminder.

8. The method of claim 1, wherein the markup language document is a Hyper Text Markup Language document, a Dynamic Hyper Text Markup Language document, or an Extensible Markup Language document.

9. A system comprising a set-top box with control circuitry configured to:

## 12

generate for display a display item having a first program function, wherein the first program function is based on a non-markup language, and the first program function is preprogrammed on the set-top box;

receive a markup language document from a remote source;

interpret the markup language document to determine that the markup language document assigns a second program function to the display item;

update the set-top box based on the markup language document such that the display item has the second program function; and

generate for display, the display item having the second program function.

10. The system of claim 9, wherein updating the set-top box is in response to a user input.

11. The system of claim 9, wherein the second program function causes a display of the display item to change in response to a user input.

12. The system of claim 9, wherein updating the set-top box comprises updating a displayed plurality of program listings being displayed on a first portion of the screen having a first size to the plurality of program listings being displayed on a second portion of the screen having a second size, where the second size is larger than the first size.
